2020-04-30 20:50:53	Chehalis Basin Flood Damage Reduction Project	Copi	Vojta	Bellingham	WA	98227	cbvphotographics@gmail.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead, Washington's beleaguered State Fish.</p> <p>Rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Copi Vojta PO Box 2503 Bellingham, WA 98227</p>

The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Kathryn Watkins 3949 S Pilgrim St Seattle, WA 98118</p>

2020-04-30 15:10:47	Chehalis Basin Flood Damage Reduction Project	Joshua	Watson	Everett	WA	98203	ironmonkey005@hotmail.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead, Washington's beleaguered State Fish.</p> <p>Rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Joshua Watson 1528 74th St SE Everett, WA 98203</p>

Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Andy Westbrock 2401 8th Ave N Seattle, WA 98109</p>

2020-04-30 16:12:11	Chehalis Basin Flood Damage Reduction Project	Felicia	wibowo	Seattle	WA	98105	feliciawibowo@hotmail.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead, Washington's beleaguered State Fish.</p> <p>Rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Gordon Wood 906 Lake Washington Blvd S Seattle, WA 98144</p>

2020-05-01 15:17:56	Chehalis Basin Flood Damage Reduction Project	Megan	wood	Auburn	WA	98001	meg.wood92@gmail.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>This is so incredibly important.</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead, Washington's beleaguered State Fish.</p> <p>Rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. To the Chehalis Basin Flood Control District:

I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead, Washington's beleaguered State Fish.

Rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.

The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.

While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.

Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.

Thank you.

To the Chehalis Basin Flood Control District:

We have reached a dire crossroads in the need for environmental integrity and responsibility. Damming the Chehalis River when other dams are being removed is irresponsible, expensive, and foolish. Restoring habitat will preserve the river and surrounding lands for the foreseeable future. It is time for those in leadership to stand up for what is right for all peoples (but primarily the tribes) and for the health of the earth and environment. The time is now and the power is yours to put health over wealth.

I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead, Washington's beleaguered State Fish.

To the Chehalis Basin Flood Control District:

I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I grew up recreating in the area and the area holds a special place in my heart. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead, Washington's beleaguered State Fish.

Rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.

The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.

While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.

Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation

patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.

Thank you,

Tiana Luke

I oppose the construction of a dam on the upper Chehalis River above the town of Pe Ell, Washington. The proposed dam is not a sustainable or practical solution to the devastating floods impacting communities throughout the Chehalis Basin. Construction of the proposed dam will NOT prevent flooding, nor will it protect residents from the most devastating flood levels such as those experienced during the 2007 event. The dam would only reduce flood damage for a limited number of citizens in the basin. Residents and businesses in the lower basin, and along other flood-prone Chehalis River tributaries would not receive any benefit from the proposed dam. We cannot rationalize the expenditure of over \$628 million in Washington state monies to build a 19th century solution that will not fix the 21st century flood problem that all basin residents face.

At a time when wild salmon and steelhead runs are in rapid decline across the Pacific Northwest, the Chehalis Basin remains one of Washington's last best chances to get salmon recovery right. Construction of the proposed dam however, with its associated support infrastructure, would decimate the opportunity for salmon in the Chehalis Basin to return to their once thriving historic population levels. A few of the significant impacts the proposed dam would have on salmon include the destruction of over 12 miles of riparian habitats, elimination of critical spawning and rearing habitat for spring Chinook and steelhead, and the increase of river temperatures to near lethal levels.

The impacts are not relegated to just salmon but will also have significant impacts on wildlife species and recreationists. Wildlife impacts include chronic disturbance during the proposed 5-year construction period, loss of breeding habitat and migratory corridors and a reduction in food resources for the already endangered Southern Resident Killer Whales. Additionally, the proposed structure would eliminate 12 miles of recreational boating opportunity and significantly decrease the fishability of the Chehalis due to both a lack of access and a decline in salmon and steelhead populations identified above.

The flooding problems we face are not new. They are over one hundred years in the making. While there is not a one-size-fits all solution, there is an urgent need to act now to make changes that will set success into motion. I support implementation of a comprehensive local actions alternative that includes:

- Elevating homes, businesses, and utilities so they are above floodwater levels
- Acquiring flood-prone properties and preventing additional floodplain development.
- Allowing uninhabited areas to flood, which slows down flood waves heading for settled areas, stores groundwater for summer use, and restores soil for agriculture.
- Replacing undersized culverts to prevent water from backing up and flooding nearby homes, buildings, and towns during heavy rain events.

We do not have 10 years to wait. We need to get to work now on solutions that are proven, are a wise investment, will reduce flood damage risk now, and will help restore the Chehalis Basin for communities, fish, wildlife, and clean water

To the Chehalis Basin Flood Control District:

I was confused when I read the headlines in the Seattle Times of Washington State proposing a dam on a river that is also a focus for salmonid habitat improvements. As well as using this sort of pinch point response as we anticipate future climate change effects that warrant restoration/enhancement processes on landscape scales across headwater streams, tributary creeks, and the main rivers of the Chehalis Watershed.

I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would impact riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead.

Rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. A few of the significant impacts the proposed dam would have on salmon include the destruction of over 12 miles of riparian habitats, elimination of critical spawning and rearing habitat for spring Chinook and steelhead, and the increase of river temperatures to near lethal levels.

The impacts are not relegated to just salmon but will also have significant impacts on wildlife species and recreationists. Wildlife impacts include chronic disturbance during the proposed 5-year

construction

period, loss of breeding habitat and migratory corridors and a reduction in food resources for the already

endangered Southern Resident Killer Whales. Additionally, the proposed structure would eliminate 12

miles of recreational boating opportunity and significantly decrease the fishability of the Chehalis due to

both a lack of access and a decline in salmon and steelhead populations identified above.

The flooding problems we face are not new. They are over one hundred years in the making.

While

there is not a one-size-fits all solution, there is an urgent need to act now to make changes that will

set success into motion. I support implementation of a comprehensive local actions alternative that includes:

- Elevating homes, businesses, and utilities so they are above floodwater levels
- Acquiring flood-prone properties and preventing additional floodplain development.
- Allowing uninhabited areas to flood, which slows down flood waves heading for settled areas, stores groundwater for summer use, and restores soil for agriculture.
- Replacing undersized culverts to prevent water from backing up and flooding nearby homes, buildings, and towns during heavy rain events.

We do not have 10 years to wait. We need to get to work now on solutions that are proven, are a

wise investment, will reduce flood damage risk now, and will help restore the Chehalis Basin for

communities, fish, wildlife, and clean water

Comments:

I stand with the Confederated Tribes of the Chehalis and the Quinault Indian Nation in opposition to the construction of a dam on the upper Chehalis River above the town of Pe Ell, Washington. While we empathize with basin citizens whose livelihoods and property have been impacted, the proposed dam is not a sustainable or practical solution to the devastating floods impacting communities throughout the Chehalis Basin. Construction of the proposed dam will NOT prevent flooding, nor will it protect residents from the most devastating flood levels such as those experienced during the 2007 event. The dam would only reduce flood damage for a limited number of citizens in the basin. Residents and businesses in the lower basin, and along other flood-prone Chehalis River tributaries would not receive any benefit from the proposed dam. We cannot rationalize the expenditure of over \$628 million in Washington state monies to build a 19th century solution that will not fix the 21st century flood problem that all basin residents face. At a time when wild salmon and steelhead runs are in rapid decline across the Pacific Northwest, the Chehalis Basin remains one of Washington's last best chances to get salmon recovery right. Construction of the proposed dam however, with its associated support infrastructure, would decimate the opportunity for salmon in the Chehalis Basin to return to their once thriving historic population levels. A few of the significant impacts the proposed dam would have on salmon include the destruction of over 12 miles of riparian habitats, elimination of critical spawning and rearing habitat for spring Chinook and steelhead, and the increase of river temperatures to near lethal levels. The impacts are not relegated to just salmon but will also have significant impacts on wildlife species and recreationists. RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WON'T do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely,

Sincerely,
Franziska Eber

I strongly oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WON'T do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

This planet is the only place we've got. We have to responsibly protect it. Please step up to the challenge, and lead!

Sincerely,

Sincerely,
Adam Resnick

- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely,

Sincerely,
Joan Walker

RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WONT do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

What the dam WONT do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely,

Sincerely,
Robert Park

RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River.

By Building this dam, you are effectively stealing the salmon of this river from future generations and the native wildlife that depends on their runs every year.

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely,

RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WONT do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

Dams have been impeding fish migration all across the NW for many years. Many of these dams are now being removed. Our fish runs must be protected. Please consider a solution that doesn't block the spawning grounds from being reached by the few fish left.

What the dam WON'T do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WON'T do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely,
Dave Godwin

RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WONT do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WONT do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely,

Sincerely,
Paula Morgan

- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely,
Lacy C.

RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WONT do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

What the dam WON'T do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely,

Sincerely,

RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WONT do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River. This is an outdated project that we know causes more harm than good, and further postpones research and implementation of more sustainable energy sources, all to the detriment of wildlife and surrounding populations.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WON'T do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat — species already on the decline.
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development - and further harm the indigenous peoples of this land. Consistently an afterthought or totally ignored population. It is unacceptable to perpetuate colonial and ignorant projects like this in the face of indigenous requests to not move forward with this plan.

We all need to do more to help salmon and decrease the flood risk. Science and common sense tell us that a dam is not the answer, nor was it ever. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WONT do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely, John Strosnider

RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River.

We need to spend our money and resources more wind and solar energy generation, and more salmon habitat, not the \$1 billion dam plan that will provide little power while ending traditional salmon and steelhead runs, ending traditional river recreation, and substantially worsening river habitat. This plan creates a huge pile of concrete that is an eyesore and gives a false sense of flood security, and has little irrigation or power potential - as Washingtonians have learned from other dam projects.

The current dam proposal from the Chehalis River Basin Flood Control District is a rushed and ill-advised attempt that will fail to solve critical water, power and environmental issues. It will end up costing taxpayers billions of dollars before the dam is eventually removed.

The dam will:

- Increase the risk of future flood damage, by triggering more development.
- Increase debris in the river from logging, increasing the chances of flooding and requiring costly ongoing debris removal.
- Drown six miles of critical salmon and steelhead habitat.
- Worsen the Chehalis River's existing water quality issues.

This plan will cost billions and people in the region deserve positive environmental results and not to be left with no fishing, a poorer hunting environment, poor water quality and a pile of concrete.

I urge you to deny approval of this plan and send the Chehalis Basin leaders back to the drawing board to seek comprehensive power, water and fish solutions that work for communities, tribes, recreational and commercial fishers, the greater ecosystem.

RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

I grew up on the Mississippi River and the levees and dams never solved the flooding or the loss of top soil. We need a different plan for the Chehalis. Dams don't work and add to global warming, accelerating climate change. This is a lose-lose proposition. Fish lose, we lose. Stop the plans for this dam.

What the dam WON'T do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely, Sheryl Krohne

RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WONT do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

I oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WON'T do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely,

Sincerely,
Elaine Fischer

RE: Don't dam the Chehalis

Dear Department of Ecology,

Hello--

I'm writing to say that I oppose the current plan to build a dam on the upper Chehalis River.

I DO understand that the heavy flooding needs to be addressed, but do not believe this is the best way to do it. There must be a balance--we need to work to find a win-win solution to address both the flooding AND the salmon and steelhead population declines.

The current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WONT do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WON'T do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely,

Sincerely,
Michael Edwards

The decline of salmon and steelhead returns are very concerning. One only needs to look at the historically ill effects dams have had on these fish....

RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WONT do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River.

Have we not learned anything from the Elwha, the White Salmon and dams in general. Flooding can be mitigated, loss of Salmon cannot. The fish, the economy, the environment and climate all win with maintaining a free flowing river. Flooding can be controlled without a dam on the Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WON'T do:

RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build an impoundment dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WONT do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Prevent the natural return of salmon and steelhead to traditional spawning grounds
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, as it will trigger more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science, experience, and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, causes too much damage, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River. As a Freshwater Biologist, I understand the long term impacts dams have on native species. In a system where native fish are already under stress from habitat alteration, new dams may help drive these fish to extinction.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

The dam, as currently proposed, WILL NOT:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities
- Safeguard native fish populations

What the dam WILL:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. Science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River. The amount of money allocated to this effort the acknowledges detrimental effects on the aquatic species in the basis is out of balance with the outcomes.

I support funding the Local Actions Alternative as a more appropriate first step in mitigation of flooding issues with agreed upon metrics of success and give this approach a 5 to 10 year implementation period. The cost is substantially less and provides better opportunity to assess impacts.

The statement in the EIS that climate change may also negatively affect fish species is speculative and building a dam does not offset that speculation. We don't know how species will adapt/evolve and the statement may come to fruition, but lets see what can be derived from the Local Actions implementation.

Respectfully
Mike Dahlstrom

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WONT do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely,

Sincerely,
Daniel Hawley

RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River.

I assumed we were past the age of dams that we learned of the damage they do to salmon and ecosystems in general and were more likely to be removed to restore the natural balance, but I guess I was wrong. Flooding a problem? Don't build in floodplains. That's how they got the name floodplains. Much cheaper. Use common sense to address the issues and work with nature.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. - Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely,

Sincerely,
Adam Resnick

RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WON'T do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely,

Sincerely,
Muhammad Jiwa

RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WON'T do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. I oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WONT do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely,

Sincerely,
Jim Rainville

RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WONT do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely,

Sincerely,
Elisabeth Raymond

RE: Don't dam the Chehalis

Dear Department of Ecology,

I OPPOSE the current plan to build a dam on the upper Chehalis River.

I grew up in the Pacific Northwest, and our land is our identifier to who we are as people and as a region. It is important that we save and conserve the Chehalis River for future generations, because it is an opportunity for people to connect with the land, history and cultures. The educational and ecological value of the Chehalis River is far beyond the possible short term fix a dam could provide the river basin. We need to start to set long term values to our ecosystems and create precedents for future generations to follow in saving our regions unique ecosystems.

“Wild places are the real soul of this country” - Yvon Chouinard

The river basin is in need of a comprehensive strategy to address; heavy flooding, reduction in the ecological system and the salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address these problems. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

It has been shown that dams and specifically the proposed dam will NOT prevent flood damage for residents throughout the basin. Historically dams have been losing monetary value in generating hydropower and will not do so for Lewis County residents. It will cost our residents more financially than what it will provide in power and flood security. Many scientific studies have shown that dams do not create or increase new recreational fishing and boating opportunities but instead damage those ecological systems by reducing biodiversity and fish populations.

The proposed dam WILL require significant logging and costly ongoing debris removal at the cost of taxpayers which will be higher than the dam's "improvements". It will drown six miles of critical salmon and steelhead habitat by worsen the Chehalis River's existing water quality issues and increasing lack of habitat. Most importantly, will increase the risk of future flood damage, if it triggers more floodplain development, harming and putting the people who live in the basin and the surrounding area at risk for losing their livelihoods and homes.

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and the benefits are too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely,
Katie Fellows

RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WON'T do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely,

Sincerely,
Bridgett Heiny

RE: Don't dam the Chehalis

Dear Department of Ecology,

We need to realize that when we think of solving a problem with a solution that goes against the flow of environmental facts, often the results are poor. That is, trying to save flooding by a dam is bound to fail in time, and will require replacement and maintenance costs that one cannot fathom at this point. I would suggest coming up with a plan that recognizes the natural flow and potential for flooding.

I oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WONT do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat

RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River.

A dam to solve flooding in the I-5 corridor is a short-sighted one-liner to make everyone feel like they're doing something without actually assessing and addressing the true sources of the problem. The problem is not the river, it's the way the river has already been manipulated by man and a dam will eventually exacerbate the problem and will NEVER bring true relief of the problem. and when other bridges and dams are crumbling, it would be a total WASTE OF MONEY to invest in new dam construction when stream restoration would cost less, interrupt people's lives less, beautify the river and draw greater tourism revenue to the area, and show greater improvement to the problem over time.

I-5 will still be closed down during flood events. Only 635 structures will be protected. And this project will cost between \$660,000-1,000,000. Those numbers don't add up to a good plan.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately, the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WON'T do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ONGOING debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- INCREASE RISK of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WONT do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely,

Sincerely,
Leah Mercado

RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River. It's absurd that we are even considering building NEW dams in the 21st century. If built, this dam would waste a huge amount of taxpayer money. Then, in a few decades, the taxpayers will be on the hook once again to tear the thing down. It's time we have better foresight from our government and decision makers.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely,

Sincerely,

RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WON'T do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. RE: Don't dam the Chehalis

Dear Department of Ecology,

I am a project manager for a fisheries enhancement group working to restore salmon habitat in SW Washington State and I oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WON'T do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

If flood control and salmon production are goals for the Chehalis Basin, spending the \$1 billion (or a portion of that) on sound habitat restoration strategies in streams damaged by historic splash damming, purchasing land most threatened by flooding and putting it into a conservation reserve, and improving the watershed's natural ability to absorb and store water rather than transport it would be a much better investment over the long term.

Sincerely,

Brice Crayne

Project Manager

Lower Columbia Fish Enhancement Group

RE: Don't dam the Chehalis

Dear Department of Ecology,

Don't jump in the water if you can't swim!!! This Chehalis Dam may not solve either problem. One big problem is rushing into a project prior to completely understanding every aspect of the project. Be careful!!!!!!

I oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WON'T do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely,

Sincerely,
Paula Morgan

RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River for several key reasons.

The Chehalis basin is in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WONT do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

The Upper Chehalis River is a stronghold for wild spring Chinook and steelhead, and building this dam would be a nail in the coffin for wild salmonids in the basin.

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely,

RE: Don't dam the Chehalis

Dear Department of Ecology,

As a former Northwesterner (Lynnwood 10 yrs; Gig Harbor 10 yrs) with family in the region and with plans to return and enjoy the steelheading as I did before moving to Florida, I strenuously oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive regional strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

The dam will not:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

But, the dam construction and operation will:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, by triggering more floodplain development, which I suspect is the real rationale for the project from a political perspective.

Everyone agrees we need to do create and promote sustainable habitat for salmon, and that we need to decrease flood risks. But science and common sense tell us this proposed dam does not adequately address both issues. And the cost is excessive while offering benefits to only a few, at the expense of the environment and the salmon habitat. We must recall that "...as go the salmon, so do we..." (a quote attributed to Chief Seattle)

I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely,
I. J. Reyes

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WON'T do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely,

Sincerely,
Jayne Loza

RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River. The following is mostly scripted, but I want you to know that as a long time Northwest resident of Gig Harbor with family in the area and with plans to return, I respectfully request that you comprehensively study the issues and come up with a viable solution that meets the needs of the community as well as the environment. We are all one.

Thank you

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

The dam will not:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

But the dam WILL:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage by encouraging further floodplain development

The need to protect salmon while decreasing the flood risk are not mutually exclusive. Both science and common sense tell us that a dam is not the solution. This proposal for the dam is not an enlightened approach. It goes too far, costs too much, and benefits too few. And it poses significant environmental risk to the salmon and encourages future environmental degradation. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely,
I. J. Reyes

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely,

Sincerely,
Daniel Hawley

RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WON'T do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River.

Are you kidding me? ALL fisheries science points to dams as an evil culprit in the functions of river ecosystems. How can anyone think of installing a dam in this day and age. Don't care about the environment? Then do an (honest) economic analysis. Look worldwide and learn the hundreds of lessons we've been taught on this topic, yet we still foolishly ignore the permanent consequences.

Mark Larson

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WONT do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely,

Sincerely,
Douglas Rohn

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely,

Sincerely,
Doug Meis

RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WONT do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely,

Sincerely,
Andrew Langford

RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WONT do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WON'T do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely,

Sincerely,
Jenna Comstock

RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WONT do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River.

I understand that the river basin needs a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem, while costing taxpayers upwards of \$1 billion. It will destroy key wild salmon habitat, and give landowners a false sense of flood security.

What the dam WONT do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WON'T do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely,

Sincerely,
Jason Strange

RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WONT do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

RE: Don't dam the Chehalis

Dear SEPA Office,

I oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WON'T do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely,

Sincerely,
Ronald Reed

- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely,

Sincerely,
Amy Waeschle

RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WONT do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

RE: Don't dam the Chehalis

Dear SEPA Office,

I oppose the current plan to build a dam on the upper Chehalis River.

The dam is an expensive boondoggle that will not solve the problem of flooding. Chehalis and Centralia are built in the flood plain of several rivers, and the hillsides where the rivers originate above the towns have been logged heavily, removing the natural capacity to absorb rainfall. Putting in a dam will do irreparable environmental damage, but not prevent flooding. Do not support this very expensive, very flawed proposal.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WON'T do:

RE: Don't dam the Chehalis

Dear SEPA Office,

I oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WONT do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely,

Sincerely,
Anthony Buch

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Sincerely,

Sincerely,
Leslie Morales

RE: Don't dam the Chehalis

Dear Department of Ecology,

I oppose the current plan to build a dam on the upper Chehalis River.

The river basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal from the Chehalis River Basin Flood Control District will not comprehensively address either problem. Instead, it is a rushed and ill-advised attempt to solve deep-seated issues. It could end up costing taxpayers upwards of \$1 billion, while worsening fish habitat and giving downstream landowners a false sense of flood security.

What the dam WON'T do:

- Prevent flood damage for residents throughout the basin
- Generate hydropower for Lewis County residents
- Supply irrigation water to Chehalis basin farmers
- Create new recreational fishing and boating opportunities

What the dam WILL do:

- Require significant logging and costly ongoing debris removal
- Drown six miles of critical salmon and steelhead habitat
- Worsen the Chehalis River's existing water quality issues
- Increase the risk of future flood damage, if it triggers more floodplain development

Everyone agrees that we need to do more to help salmon and decrease the flood risk. But science and common sense tell us that a dam is not the answer. This dam goes too far, costs too much, and benefits too few. I urge you to send the Chehalis Basin leaders back to the drawing board to seek comprehensive solutions that work for communities, tribes, recreational and commercial fishers, and the greater ecosystem.

Diane,

I am submitting the attached 192 comments on behalf of the supporters of the Chehalis River Alliance who took the time to speak up and share their thoughts on this important environmental review process. If you need anything else from me, please let me know.

Thank you and best regards,

Paul

This project would degrade critical spawning grounds for Chinook, coho salmon, and steelhead, further endangering these struggling fish populations that are vital to the basin's economy and environment. The project would also destroy hundreds of acres of quality forest, riparian habitat, and wetlands, which are essential for the diverse wildlife populations living in the Chehalis Basin and serve as critical migratory routes and connected habitat for wildlife such as elk and the endangered marbled murrelet. Additionally, the Draft Environmental Impact Statement fails to meet some basic requirements of the State Environmental Policy Act because it: 1) Lacks the mitigation measures to address the significant impacts the DEIS details, which hinders the public's ability to make informed decisions about the project. 2) Does not sufficiently analyze the least environmentally-harmful alternatives to the proposed dam. 3) Fails to properly acknowledge the full scale of environmental impacts the proposed dam would generate as well as the future impacts of the "expanded" version of this dam that is discussed in the DEIS. 4) Ignores the substantial impacts the proposed dam would have on the migratory routes and connected habitats wildlife need and fails to propose how these impacts could be mitigated. For all of these reasons, I oppose the Chehalis River Basin Flood Damage Reduction Project. However, while this proposal and DEIS are unacceptable, it is important to acknowledge that the status quo is also untenable. We need a basin-wide approach to flood resiliency that benefits local communities, protects residents, and protects our wild fish and wildlife populations. I encourage the Chehalis Basin leaders to go back to the drawing board to develop a comprehensive solution that more effectively addresses the basin's challenges of flood control and fish recovery. Thank you for your work to create a brighter future for the Chehalis Basin and for your consideration of my comments. I hope I'm able to fish the basin undammed and with healthy stocks of steelhead and salmon in the future.</p>

2020-05-19 16:09:47 EST	Kevin	Quinn	Qman714@hotmail.com	1525 SW Park Ave., B303	Portland	Oregon	97201	Please Don't Dam the Chehalis	<p>I am writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. While I strongly support the state's efforts to mitigate the impacts of flooding in the Chehalis Basin, the proposal to build a large dam on the Chehalis River is not the right approach to address this serious issue. The Chehalis Basin communities deserve thoughtful, well-designed, and fiscally-sound solutions to address the basin's twin challenges of flood control and wild fish recovery. Unfortunately, the current dam proposal from the Chehalis Basin Flood Control District does not sufficiently address the flooding problem, would dramatically accelerate the decline of wild fish populations, and would cost taxpayers upwards of \$628 million. I am particularly concerned about spending \$628 million taxpayer dollars on a flood mitigation approach that will not excel at the one thing is intended to do – protect people from catastrophic flooding. According to the DEIS, in the event of another major flood event like 2007, the towns of Centralia and Chehalis would still experience serious flooding. Moreover, this lack of flood protection benefit is especially true the farther you move away from the proposed dam site because down-basin towns like Aberdeen would only experience 2 inches of flood reduction. I am also concerned about the irreparable harm the dam would have on wild fish and wildlife populations. This project would degrade critical spawning grounds for Chinook, coho salmon, and steelhead, further endangering these struggling fish populations that are vital to the basin's economy and environment. The project would also destroy hundreds of acres of quality forest, riparian habitat, and wetlands, which are essential for the diverse wildlife populations living in the Chehalis Basin and serve as critical migratory routes and connected habitat for wildlife such as elk and the endangered marbled murrelet. <p>2020-05-19 20:55:04 EST</p>	<p>Fritz</p>	<p>Nichols</p>	<p>fritznicholsjr@gmail.com</p>	<p>1803 w 28th ave</p>	<p>Spokane</p>	<p>Washington</p>	<p>99224</p>	<p>Please Don't Dam the Chehalis</p>	<p>The proposed dam is an attempt to move us in a direction opposite of that which we should be progressing. We have lost countless gene pools of amazing salmon and steelhead up and down the west coast over the last 100 years or more. The reasons for these losses are multiple. Dams are near the top of this list. In a time when we are about to lose our endangered Snake River stocks where dam removal is THE one remaining option that has any possibility of helping to restore these runs of fish and to prevent us and future generations from losing them forever, we are insanely discussing the possibility of blocking another sensitive river system where the fish are already very sensitive and under threat. I am writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. While I strongly support the state's efforts to mitigate the impacts of flooding in the Chehalis Basin, the proposal to build a large dam on the Chehalis River is not the right approach to address this serious issue. 2020-05-19 23:34:22 EST	Jason	Chadick	jasonpchadick@gmail.com	832 E Angeles Ridge Rd.	Port Angeles	Washington	98362	Please Don't Dam the Chehalis	<p>My name is Jason Chadick and I am a teacher at Sequim Middle School. This is the second time I have submitted a comment regarding the proposed dam on the Chehalis River. The first time I commented was at a public zoom meeting at the end of April. The environmental impact statement alone makes it clear that the proposed dam is a terrible idea. But furthermore, it does not provide the flood security that people are looking for. It's the wrong project in the wrong place. I am writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. While I strongly support the state's efforts to mitigate the impacts of flooding in the Chehalis Basin, the proposal to build a large dam on the Chehalis River is not the right approach to address this serious issue. The Chehalis Basin communities deserve thoughtful, well-designed, and fiscally-sound solutions to address the basin's twin challenges of flood control and wild fish recovery. Unfortunately, the current dam proposal from the Chehalis Basin Flood Control District does not sufficiently address the flooding problem, would dramatically accelerate the decline of wild fish populations, and would cost taxpayers upwards of \$628 million. While I strongly support the state's efforts to mitigate the impacts of flooding in the Chehalis Basin, the proposal to build a large dam on the Chehalis River is not the right approach to address this serious issue. The Chehalis Basin communities deserve thoughtful, well-designed, and fiscally-sound solutions to address the basin's twin challenges of flood control and wild fish recovery. Unfortunately, the current dam proposal from the Chehalis Basin Flood Control District does not sufficiently address the flooding problem, would dramatically accelerate the decline of wild fish populations, and would cost taxpayers upwards of \$628 million. I am particularly concerned about spending \$628 million taxpayer dollars on a flood mitigation approach that will not excel at the one thing is intended to do – protect people from catastrophic flooding. According to the DEIS, in the event of another major flood event like 2007, the towns of Centralia and Chehalis would still experience serious flooding. Moreover, this lack of flood protection benefit is especially true the farther you move away from the proposed dam site because down-basin towns like Aberdeen would only experience 2 inches of flood reduction. I am also concerned about the irreparable harm the dam would have on wild fish and wildlife populations. This project would degrade critical spawning grounds for Chinook, coho salmon, and steelhead, further endangering these struggling fish populations that are vital to the basin's economy and environment. The project would also destroy hundreds of acres of quality forest, riparian habitat, and wetlands, which are essential for the diverse wildlife populations living in the Chehalis Basin and serve as critical migratory routes and connected habitat for wildlife such as elk and the endangered marbled murrelet. Additionally, the Draft Environmental Impact Statement fails to meet some basic requirements of the State Environmental Policy Act because it: 1) Lacks the mitigation measures to address the significant impacts the DEIS details, which hinders the public's ability to make informed decisions about the project. 2) Does not sufficiently analyze the least environmentally-harmful alternatives to the proposed dam. 3) Fails to properly acknowledge the full scale of environmental impacts the proposed dam would generate as well as the future impacts of the "expanded" version of this dam that is discussed in the DEIS. 4) Ignores the substantial impacts the proposed dam would have on the migratory routes and connected habitats wildlife need and fails to propose how these impacts could be mitigated. For all of these reasons, I oppose the Chehalis River Basin Flood Damage Reduction Project. However, while this proposal and DEIS are unacceptable, it is important to acknowledge that the status quo is also untenable. We need a basin-wide approach to flood resiliency that benefits local communities, protects residents, and protects our wild fish and wildlife populations. I encourage the Chehalis Basin leaders to go back to the drawing board to develop a comprehensive solution that more effectively addresses the basin's challenges of flood control and fish recovery. Thank you for your work to create a brighter future for the Chehalis Basin and for your consideration of my comments.</p>

2020-05-20 18:27:55 EST	Toni	Long	tlongsea@gmail.com	2311 N. 38th Street	Seattle	Washington	98103	Please Don't build a Dam on the Chehalis	I am writing with regards to the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I understand the need for the state to mitigate the impacts of flooding in the Chehalis Basin. However, I do not support the proposal to build a dam on the Chehalis River. This is not the right solution, as it inadequately addresses the flooding issue and severely endangers the salmon and steelhead fish in the Chehalis River and, in turn, the Oras that rely on this food source. I am concerned about spending \$628 million taxpayer dollars on a dam that will not protect people from catastrophic flooding. According to the DEIS, in the event of another major flood event like 2007, the towns of Centralia and Chehalis would still experience serious flooding, as would down-basin towns. I am equally concerned about the irreparable harm the dam would have on wild fish and wildlife populations and hundreds of acres of quality forest, riparian habitat, and wetlands, which are essential for the diverse wildlife populations living in the Chehalis Basin and serve as critical migratory routes and connected habitat for wildlife. In summary, I oppose the Chehalis River Basin Flood Damage Reduction Project as the solution, but also want to state that the status quo is untenable. We need a basin-wide approach to flood resiliency that benefits local communities, protects residents, and protects our wild fish and wildlife populations. Thank you for your consideration of my comments.
2020-05-20 21:04:45 EST	Charles	Swanston	cswanston44@gmail.com	585 Blue Wing Loop SE	Ocean Shores	Washington	98569	Please Don't Dam the Chehalis	I am writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. While I strongly support the state's efforts to mitigate the impacts of flooding in the Chehalis Basin, the proposal to build a large dam on the Chehalis River is not the right approach to address this serious issue. The Chehalis Basin communities deserve thoughtful, well-designed, and fiscally-sound solutions to address the basin's twin challenges of flood control and wild fish recovery. Unfortunately, the current dam proposal from the Chehalis Basin Flood Control District does not sufficiently address the flooding problem, would dramatically accelerate the decline of wild fish populations, and would cost taxpayers upwards of \$628 million. I am particularly concerned about spending \$628 million taxpayer dollars on a flood mitigation approach that will not excel at the one thing is intended to do – protect people from catastrophic flooding. According to the DEIS, in the event of another major flood event like 2007, the towns of Centralia and Chehalis would still experience serious flooding. Moreover, this lack of flood protection benefit is especially true the farther you move away from the proposed dam site because down-basin towns like Aberdeen would only experience 2 inches of flood reduction. I am also concerned about the irreparable harm the dam would have on wild fish and wildlife populations. This project would degrade critical spawning grounds for Chinook, coho salmon, and steelhead, further endangering these struggling fish populations that are vital to the basin's economy and environment. The project would also destroy hundreds of acres of quality forest, riparian habitat, and wetlands, which are essential for the diverse wildlife populations living in the Chehalis Basin and serve as critical migratory routes and connected habitat for wildlife such as elk and the endangered marbled murrelet. Additionally, the Draft Environmental Impact Statement fails to meet some basic requirements of the State Environmental Policy Act because it: 1) Lacks the mitigation measures to address the significant impacts the DEIS details, which hinders the public's ability to make informed decisions about the project. 2) Does not sufficiently analyze the least environmentally-harmful alternatives to the proposed dam. 3) Fails to properly acknowledge the full scale of environmental impacts the proposed dam would generate as well as the future impacts of the "expanded" version of this dam that is discussed in the DEIS. 4) Ignores the substantial impacts the proposed dam would have on the migratory routes and connected habitats wildlife need and fails to propose how these impacts could be mitigated. For all of these reasons, I oppose the Chehalis River Basin Flood Damage

									Reduction Project. However, while this proposal and DEIS are unacceptable, it is important to acknowledge that the status quo is also untenable. We need a basin-wide approach to flood resiliency that benefits local communities, protects residents, and protects our wild fish and wildlife populations. I encourage the Chehalis Basin leaders to go back to the drawing board to develop a comprehensive solution that more effectively addresses the basin's challenges of flood control and fish recovery. Thank you for your work to create a brighter future for the Chehalis Basin and for your consideration of my comments.

I am also concerned about the irreparable harm the dam would have on wild fish and wildlife populations. This project would degrade critical spawning grounds for Chinook, coho salmon, and steelhead, further endangering these struggling fish populations that are vital to the basin's economy and environment. The project would also destroy hundreds of acres of quality forest, riparian habitat, and wetlands, which are essential for the diverse wildlife populations living in the Chehalis Basin and serve as critical migratory routes and connected habitat for wildlife such as elk and the endangered marbled murrelet. Additionally, the Draft Environmental Impact Statement fails to meet some basic requirements of the State Environmental Policy Act because it: 1) Lacks the mitigation measures to address the significant impacts the DEIS details, which hinders the public's ability to make informed decisions about the project. 2) Does not sufficiently analyze the least environmentally-harmful alternatives to the proposed dam. 3) Fails to properly acknowledge the full scale of environmental impacts the proposed dam would generate as well as the future impacts of the "expanded" version of this dam that is discussed in the DEIS. 4) Ignores the substantial impacts the proposed dam would have on the migratory routes and connected habitats wildlife need and fails to propose how these impacts could be mitigated. For all of these reasons, I oppose the Chehalis River Basin Flood Damage Reduction Project. However, while this proposal and DEIS are unacceptable, it is important to acknowledge that the status quo is also untenable. We need a basin-wide approach to flood resiliency that benefits local communities, protects residents, and protects our wild fish and wildlife populations. I encourage the Chehalis Basin leaders to go back to the drawing board to develop a comprehensive solution that more effectively addresses the basin's challenges of flood control and fish recovery. Thank you for your work to create a brighter future for the Chehalis Basin and for your consideration of my comments.</p>

2020-05-22 11:34:02 EST	Daniel	Driver	dandriver9@gmail.com	215 Tillie Ave	Peell	Washington	98572	Please Don't Dam the Chehalis	<p>I am writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. While I strongly support the state's efforts to mitigate the impacts of flooding in the Chehalis Basin, the proposal to build a large dam on the Chehalis River is not the right approach to address this serious issue. The Chehalis Basin communities deserve thoughtful, well-designed, and fiscally-sound solutions to address the basin's twin challenges of flood control and wild fish recovery. Unfortunately, the current dam proposal from the Chehalis Basin Flood Control District does not sufficiently address the flooding problem, would dramatically accelerate the decline of wild fish populations, and would cost taxpayers upwards of \$628 million. I am particularly concerned about spending \$628 million taxpayer dollars on a flood mitigation approach that will not excel at the one thing is intended to do – protect people from catastrophic flooding. According to the DEIS, in the event of another major flood event like 2007, the towns of Centralia and Chehalis would still experience serious flooding. Moreover, this lack of flood protection benefit is especially true the farther you move away from the proposed dam site because down-basin towns like Aberdeen would only experience 2 inches of flood reduction. I am also concerned about the irreparable harm the dam would have on wild fish and wildlife populations. This project would degrade critical spawning grounds for Chinook, coho salmon, and steelhead, further endangering these struggling fish populations that are vital to the basin's economy and environment. The project would also destroy hundreds of acres of quality forest, riparian habitat, and wetlands, which are essential for the diverse wildlife populations living in the Chehalis Basin and serve as critical migratory routes and connected habitat for wildlife such as elk and the endangered marbled murrelet. Additionally, the Draft Environmental Impact Statement fails to meet some basic requirements of the State Environmental Policy Act because it: 1) Lacks the mitigation measures to address the significant impacts the DEIS details, which hinders the public's ability to make informed decisions about the project. 2) Does not sufficiently analyze the least environmentally-harmful alternatives to the proposed dam. 3) Fails to properly acknowledge the full scale of environmental impacts the proposed dam would generate as well as the future impacts of the "expanded" version of this dam that is discussed in the DEIS. 4) Ignores the substantial impacts the proposed dam would have on the migratory routes and connected habitats wildlife need and fails to propose how these impacts could be mitigated. For all of these reasons, I oppose the Chehalis River Basin Flood Damage Reduction Project. However, while this proposal and DEIS are unacceptable, it is important to acknowledge that the status quo is also untenable. 2020-05-22 16:20:29 EST	Judy	Todd	judy@natureconnectnw.com	1631 NE Broadway St. #723	Portland	Oregon	97232	Please Don't Dam the Chehalis	<p>Thanks for considering my remarks on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. While I support the state's efforts to mitigate the impacts of flooding in the Chehalis Basin, the proposal to build a water retention unit (aka dam) on the Chehalis River is not the right approach to address the current conditions nor the future needs of people, salmon and habitat. The Chehalis Basin communities deserve thoughtful, well-designed, and fiscally-sound solutions to address the basin's twin challenges of flood control and wild fish recovery. Unfortunately, the current dam proposal from the Chehalis Basin Flood Control District is insufficient in addressing the complexity interrelatedness of the areas larger, complex issues, and the longer, uncertain climate future. I believe your proposal would accomplish ending any possibility of real success of wild fish populations. And the public would be paying for that loss. That's backwards. I am also concerned about spending \$628 million taxpayer dollars on a flood mitigation approach that will not protect people from catastrophic flooding. According to the DEIS, in the event of another major flood event like 2007, the towns of Centralia and Chehalis would still experience serious flooding. Moreover, this lack of flood protection benefit is especially true the farther you move away from the proposed dam site because down-basin towns like Aberdeen would only experience 2 inches of flood reduction. I am aware that your proposed plan will cause irreparable harm of critical spawning grounds for Chinook, coho salmon, and steelhead, further endangering these struggling fish populations that are vital to the basin's economy and environment. That destruction will be exacerbated by losses of quality forest, riparian habitat, and wetlands, which are essential for the diverse wildlife populations living in the Chehalis Basin and serve as critical migratory routes and connected habitat for wildlife such as elk and the endangered marbled murrelet. Additionally, the Draft Environmental Impact Statement fails to meet some basic requirements of the State Environmental Policy Act because it: 1) Lacks the mitigation measures to address the significant impacts the DEIS details, which hinders the public's ability to make informed decisions about the project. 2) Does not sufficiently analyze the least environmentally-harmful alternatives to the proposed dam. 3) Fails to properly acknowledge the full scale of environmental impacts the proposed dam would generate as well as the future impacts of the "expanded" version of this dam that is discussed in the DEIS. 4) Ignores the substantial impacts the proposed dam would have on the migratory routes and connected habitats wildlife need and fails to propose how these impacts could be mitigated. For all of these reasons, I oppose and object to the Chehalis River Basin Flood Damage Reduction Project. However, while this proposal and DEIS are unacceptable, it is important to acknowledge that the status quo is also untenable. We need a basin-wide approach to flood resiliency that benefits local communities, protects residents, and protects our wild fish and wildlife populations. I encourage the Chehalis Basin leaders to go back to the drawing board to develop a comprehensive solution that more effectively addresses the basin's challenges of flood control and fish recovery. Thank you for your work to create a brighter future for the Chehalis Basin and for your consideration of my comments.</p>

For all of these reasons, I oppose the Chehalis River Basin Flood Damage Reduction Project. However, while this proposal and DEIS are unacceptable, it is important to acknowledge that the status quo is also untenable. We need a basin-wide approach to flood resiliency that benefits local communities, protects residents, and protects our wild fish and wildlife populations. I encourage the Chehalis Basin leaders to go back to the drawing board to develop a comprehensive solution that more effectively addresses the basin's challenges of flood control and fish recovery. Thank you for your work to create a brighter future for the Chehalis Basin and for your consideration of my comments.</p>

2020-05-24 22:30:08 EST	Jacob	Mjaanes	jacob.mjaanes@gmail.com	117 Plymouth St NW	Olympia	Washington	98502	Please Don't Dam the Chehalis	<p>I am writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. While I strongly support the state's efforts to mitigate the impacts of flooding in the Chehalis Basin, the proposal to build a large dam on the Chehalis River is not the right approach to address this serious issue. The Chehalis Basin communities deserve thoughtful, well-designed, and fiscally-sound solutions to address the basin's twin challenges of flood control and wild fish recovery. Unfortunately, the current dam proposal from the Chehalis Basin Flood Control District does not sufficiently address the flooding problem, would dramatically accelerate the decline of wild fish populations, and would cost taxpayers upwards of \$628 million. I am particularly concerned about spending \$628 million taxpayer dollars on a flood mitigation approach that will not excel at the one thing is intended to do – protect people from catastrophic flooding. According to the DEIS, in the event of another major flood event like 2007, the towns of Centralia and Chehalis would still experience serious flooding. Moreover, this lack of flood protection benefit is especially true the farther you move away from the proposed dam site because down-basin towns like Aberdeen would only experience 2 inches of flood reduction. I am also concerned about the irreparable harm the dam would have on wild fish and wildlife populations. This project would degrade critical spawning grounds for Chinook, coho salmon, and steelhead, further endangering these struggling fish populations that are vital to the basin's economy and environment. The project would also destroy hundreds of acres of quality forest, riparian habitat, and wetlands, which are essential for the diverse wildlife populations living in the Chehalis Basin and serve as critical migratory routes and connected habitat for wildlife such as elk and the endangered marbled murrelet. We have already seen the benefits of the Elwha dam removal, why build another? Additionally, the Draft Environmental Impact Statement fails to meet some basic requirements of the State Environmental Policy Act because it: 1) Lacks the mitigation measures to address the significant impacts the DEIS details, which hinders the public's ability to make informed decisions about the project. 2) Does not sufficiently analyze the least environmentally-harmful alternatives to the proposed dam. 3) Fails to properly acknowledge the full scale of environmental impacts the proposed dam would generate as well as the future impacts of the "expanded" version of this dam that is discussed in the DEIS. 4) Ignores the substantial impacts the proposed dam would have on the migratory routes and connected habitats wildlife need and fails to propose how these impacts could be mitigated. For all of these reasons, I oppose the Chehalis River Basin Flood Damage Reduction Project. However, while this proposal and DEIS are unacceptable, it is important to acknowledge that the status quo is also untenable. We need a basin-wide approach to flood resiliency that benefits local communities, protects residents, and protects our wild fish and wildlife populations. 2020-05-25 04:34:40 EST	Evan	Dulin	nevulin@yahoo.com	428 Coal Creek Road	Chehalis	Washington	98532	Please Don't Dam the Chehalis	<p>I am writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. While I strongly support the state's efforts to mitigate the impacts of flooding in the Chehalis Basin, the proposal to build a large dam on the Chehalis River is not the right approach to address this serious issue. The Chehalis Basin communities deserve thoughtful, well-designed, and fiscally-sound solutions to address the basin's twin challenges of flood control and wild fish recovery. Unfortunately, the current dam proposal from the Chehalis Basin Flood Control District does not sufficiently address the flooding problem, would dramatically accelerate the decline of wild fish populations, and would cost taxpayers upwards of \$628 million. I am particularly concerned about spending \$628 million taxpayer dollars on a flood mitigation approach that will not excel at the one thing is intended to do – protect people from catastrophic flooding. According to the DEIS, in the event of another major flood event like 2007, the towns of Centralia and Chehalis would still experience serious flooding. Moreover, this lack of flood protection benefit is especially true the farther you move away from the proposed dam site because down-basin towns like Aberdeen would only experience 2 inches of flood reduction. I am also concerned about the irreparable harm the dam would have on wild fish and wildlife populations. This project would degrade critical spawning grounds for Chinook, coho salmon, and steelhead, further endangering these struggling fish populations that are vital to the basin's economy and environment. The project would also destroy hundreds of acres of quality forest, riparian habitat, and wetlands, which are essential for the diverse wildlife populations living in the Chehalis Basin and serve as critical migratory routes and connected habitat for wildlife such as elk and the endangered marbled murrelet. Additionally, the Draft Environmental Impact Statement fails to meet some basic requirements of the State Environmental Policy Act because it: 1) Lacks the mitigation measures to address the significant impacts the DEIS details, which hinders the public's ability to make informed decisions about the project. 2) Does not sufficiently analyze the least environmentally-harmful alternatives to the proposed dam. 3) Fails to properly acknowledge the full scale of environmental impacts the proposed dam would generate as well as the future impacts of the "expanded" version of this dam that is discussed in the DEIS. 4) Ignores the substantial impacts the proposed dam would have on the migratory routes and connected habitats wildlife need and fails to propose how these impacts could be mitigated. For all of these reasons, I oppose the Chehalis River Basin Flood Damage Reduction Project. However, while this proposal and DEIS are unacceptable, it is important to acknowledge that the status quo is also untenable. We need a basin-wide approach to flood resiliency that benefits local communities, protects residents, and protects our wild fish and wildlife populations. I encourage the Chehalis Basin leaders to go back to the drawing board to develop a comprehensive solution that more effectively addresses the basin's challenges of flood control and fish recovery. Thank you for your work to create a brighter future for the Chehalis Basin and for your consideration of my comments.</p>

2020-05-25 19:34:46 EST	Alex	Kulha	akakulha@gmail.com	13136 201st Ave SW Unit B	Rochester	Washington	98579	Please Don't Dam the Chehalis	<p>I am writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. While I strongly support the state's efforts to mitigate the impacts of flooding in the Chehalis Basin, the proposal to build a large dam on the Chehalis River is not the right approach to address this serious issue. The Chehalis Basin communities deserve thoughtful, well-designed, and fiscally-sound solutions to address the basin's twin challenges of flood control and wild fish recovery. Unfortunately, the current dam proposal from the Chehalis Basin Flood Control District does not sufficiently address the flooding problem, would dramatically accelerate the decline of wild fish populations, and would cost taxpayers upwards of \$628 million. I am particularly concerned about spending \$628 million taxpayer dollars on a flood mitigation approach that will not excel at the one thing is intended to do – protect people from catastrophic flooding. According to the DEIS, in the event of another major flood event like 2007, the towns of Centralia and Chehalis would still experience serious flooding. Moreover, this lack of flood protection benefit is especially true the farther you move away from the proposed dam site because down-basin towns like Aberdeen would only experience 2 inches of flood reduction. I am also concerned about the irreparable harm the dam would have on wild fish and wildlife populations. This project would degrade critical spawning grounds for Chinook, coho salmon, and steelhead, further endangering these struggling fish populations that are vital to the basin's economy and environment. The project would also destroy hundreds of acres of quality forest, riparian habitat, and wetlands, which are essential for the diverse wildlife populations living in the Chehalis Basin and serve as critical migratory routes and connected habitat for wildlife such as elk and the endangered marbled murrelet. Additionally, the Draft Environmental Impact Statement fails to meet some basic requirements of the State Environmental Policy Act because it: 1) Lacks the mitigation measures to address the significant impacts the DEIS details, which hinders the public's ability to make informed decisions about the project. 2) Does not sufficiently analyze the least environmentally-harmful alternatives to the proposed dam. 3) Fails to properly acknowledge the full scale of environmental impacts the proposed dam would generate as well as the future impacts of the "expanded" version of this dam that is discussed in the DEIS. 4) Ignores the substantial impacts the proposed dam would have on the migratory routes and connected habitats wildlife need and fails to propose how these impacts could be mitigated. For all of these reasons, I oppose the Chehalis River Basin Flood Damage Reduction Project. However, while this proposal and DEIS are unacceptable, it is important to acknowledge that the status quo is also untenable. We need a basin-wide approach to flood resiliency that benefits local communities, protects residents, and protects our wild fish and wildlife populations. I encourage the Chehalis Basin leaders to go back to the drawing board to develop a comprehensive solution that more effectively addresses the basin's challenges of flood control and fish recovery. Thank you for your work to create a brighter future for the Chehalis Basin and for your consideration of my comments.</p>

While I strongly support the state's efforts to mitigate the impacts of flooding in the Chehalis Basin, the proposal to build a large dam on the Chehalis River is not the right approach to address this serious issue. The Chehalis Basin communities deserve thoughtful, well-designed, and fiscally-sound solutions to address the basin's twin challenges of flood control and wild fish recovery. Unfortunately, the current dam proposal from the Chehalis Basin Flood Control District does not sufficiently address the flooding problem, would dramatically accelerate the decline of wild fish populations, and would cost taxpayers upwards of \$628 million. I am particularly concerned about spending \$628 million taxpayer dollars on a flood mitigation approach that will not excel at the one thing is intended to do – protect people from catastrophic flooding. According to the DEIS, in the event of another major flood event like 2007, the towns of Centralia and Chehalis would still experience serious flooding. Moreover, this lack of flood protection benefit is especially true the farther you move away from the proposed dam site because down-basin towns like Aberdeen would only experience 2 inches of flood reduction. I am also concerned about the irreparable harm the dam would have on wild fish and wildlife populations. This project would degrade critical spawning grounds for Chinook, coho salmon, and steelhead, further endangering these struggling fish populations that are vital to the basin's economy and environment. The project would also destroy hundreds of acres of quality forest, riparian habitat, and wetlands, which are essential for the diverse wildlife populations living in the Chehalis Basin and serve as critical migratory routes and connected habitat for wildlife such as elk and the endangered marbled murrelet. Additionally, the Draft Environmental Impact Statement fails to meet some basic requirements of the State Environmental Policy Act because it: 1) Lacks the mitigation measures to address the significant impacts the DEIS details, which hinders the public's ability to make informed decisions about the project. 2) Does not sufficiently analyze the least environmentally-harmful alternatives to the proposed dam. 3) Fails to properly acknowledge the full scale of environmental impacts the proposed dam would generate as well as the future impacts of the "expanded" version of this dam that is discussed in the DEIS. 4) Ignores the substantial impacts the proposed dam would have on the migratory routes and connected habitats wildlife need and fails to propose how these impacts could be mitigated. For all of these reasons, I oppose the Chehalis River Basin Flood Damage Reduction Project. However, while this proposal and DEIS are unacceptable, it is important to acknowledge that the status quo is also untenable. We need a basin-wide approach to flood resiliency that benefits local communities, protects residents, and protects our wild fish and wildlife populations. I encourage the Chehalis Basin leaders to go back to the drawing board to develop a comprehensive solution that more effectively addresses the basin's challenges of flood control and fish recovery. Thank you for your work to create a brighter future for the Chehalis Basin and for your consideration of my comments.</p>

2020-05-26 13:18:44 EST	Maryclair	Rigby	maryclair.rigby@gmail.com	13136 201st Ave SW, Unit B	Rochester	Washington	98579	The Chehalis Dam	<p>Please do not construct a Chehalis river dam. This would be catastrophic to future generations of people and lead to extinction of salmon and other animals who live within these fragile riparian ecosystems. It will be catastrophic not only to future generations of people but the current residents of the Chehalis basin. The very fact that we are expecting an earthquake at any moment is telling that it is totally irresponsible to build a dam which will devastate the town of Pe ell, when the earth quake occurs.</p> <p>This dam threatens people, salmon, orca whales, and all creatures big and small. The era of the dam is over.</p> <p>To use billions of taxpayer dollars for a system that is reckless is unjust.</p> <p>I say all this as a resident on the Chehalis flood plain. I have endured many floods here, and know building a dam is not the answer. I suggest we begin by looking at the forest management strategies by Weyerhaeuser which cause thousands of yearly landslides into the Chehalis river exacerbating flooding, poor water quality, and erosion. This corporation does not function with public interest in mind. We need to find a solution to catastrophic flooding that actually makes sense.</p> <p>Please, do not allow the Chehalis river dam.</p>

2020-05-26 15:52:35 EST	Justin	Buonanoma	jbuonanoma@gmail.com	1625 Murrieta ct	Reno	Nevada	89511	Please Don't Dam the Chehalis	<p>I am writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. While I strongly support the state's efforts to mitigate the impacts of flooding in the Chehalis Basin, the proposal to build a large dam on the Chehalis River is not the right approach to address this serious issue. The Chehalis Basin communities deserve thoughtful, well-designed, and fiscally-sound solutions to address the basin's twin challenges of flood control and wild fish recovery. Unfortunately, the current dam proposal from the Chehalis Basin Flood Control District does not sufficiently address the flooding problem, would dramatically accelerate the decline of wild fish populations, and would cost taxpayers upwards of \$628 million. I am particularly concerned about spending \$628 million taxpayer dollars on a flood mitigation approach that will not excel at the one thing is intended to do – protect people from catastrophic flooding. According to the DEIS, in the event of another major flood event like 2007, the towns of Centralia and Chehalis would still experience serious flooding. Moreover, this lack of flood protection benefit is especially true the farther you move away from the proposed dam site because down-basin towns like Aberdeen would only experience 2 inches of flood reduction. I am also concerned about the irreparable harm the dam would have on wild fish and wildlife populations. This project would degrade critical spawning grounds for Chinook, coho salmon, and steelhead, further endangering these struggling fish populations that are vital to the basin's economy and environment. The project would also destroy hundreds of acres of quality forest, riparian habitat, and wetlands, which are essential for the diverse wildlife populations living in the Chehalis Basin and serve as critical migratory routes and connected habitat for wildlife such as elk and the endangered marbled murrelet. Additionally, the Draft Environmental Impact Statement fails to meet some basic requirements of the State Environmental Policy Act because it: 1) Lacks the mitigation measures to address the significant impacts the DEIS details, which hinders the public's ability to make informed decisions about the project. 2) Does not sufficiently analyze the least environmentally-harmful alternatives to the proposed dam. 3) Fails to properly acknowledge the full scale of environmental impacts the proposed dam would generate as well as the future impacts of the "expanded" version of this dam that is discussed in the DEIS. 4) Ignores the substantial impacts the proposed dam would have on the migratory routes and connected habitats wildlife need and fails to propose how these impacts could be mitigated. For all of these reasons, I oppose the Chehalis River Basin Flood Damage Reduction Project. However, while this proposal and DEIS are unacceptable, it is important to acknowledge that the status quo is also untenable. We need a basin-wide approach to flood resiliency that benefits local communities, protects residents, and protects our wild fish and wildlife populations. I encourage the Chehalis Basin leaders to go back to the drawing board to develop a comprehensive solution that more effectively addresses the basin's challenges of flood control and fish recovery. Thank you for your work to create a brighter future for the Chehalis Basin and for your consideration of my comments.</p>

Thank you for your work to create a brighter future for the Chehalis Basin and for your consideration of my comments. P.S. as a Fisheries Biologist working in the region for the state RFEF program, I have seen first hand the impact of dams and structures alike. I fully oppose this project and hope you and your team accept the facts against this. As an avid recreationist in the watershed I would not return if a dam is built as it would go against my moral standards. Thank you for your time.</p>

2020-05-26 16:58:39 EST	Caryn	Graves	caryn@lmi.net	1642 Curtis St.	Berkeley	California	94702-1329	Please Don't Dam the Chehalis	<p>I am writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. While I strongly support the state's efforts to mitigate the impacts of flooding in the Chehalis Basin, the proposal to build a large dam on the Chehalis River is not the right approach to address this serious issue. The Chehalis Basin communities deserve thoughtful, well-designed, and fiscally-sound solutions to address the basin's twin challenges of flood control and wild fish recovery. Unfortunately, the current dam proposal from the Chehalis Basin Flood Control District does not sufficiently address the flooding problem, would dramatically accelerate the decline of wild fish populations, and would cost taxpayers upwards of \$628 million. I am particularly concerned about spending \$628 million taxpayer dollars on a flood mitigation approach that will not excel at the one thing is intended to do – protect people from catastrophic flooding. According to the DEIS, in the event of another major flood event like 2007, the towns of Centralia and Chehalis would still experience serious flooding. Moreover, this lack of flood protection benefit is especially true the farther you move away from the proposed dam site because down-basin towns like Aberdeen would only experience 2 inches of flood reduction. I am also concerned about the irreparable harm the dam would have on wild fish and wildlife populations. This project would degrade critical spawning grounds for Chinook, coho salmon, and steelhead, further endangering these struggling fish populations that are vital to the basin's economy and environment. The project would also destroy hundreds of acres of quality forest, riparian habitat, and wetlands, which are essential for the diverse wildlife populations living in the Chehalis Basin and serve as critical migratory routes and connected habitat for wildlife such as elk and the endangered marbled murrelet. Additionally, the Draft Environmental Impact Statement fails to meet some basic requirements of the State Environmental Policy Act because it: 1) Lacks the mitigation measures to address the significant impacts the DEIS details, which hinders the public's ability to make informed decisions about the project. 2) Does not sufficiently analyze the least environmentally-harmful alternatives to the proposed dam. 3) Fails to properly acknowledge the full scale of environmental impacts the proposed dam would generate as well as the future impacts of the "expanded" version of this dam that is discussed in the DEIS. 4) Ignores the substantial impacts the proposed dam would have on the migratory routes and connected habitats wildlife need and fails to propose how these impacts could be mitigated. For all of these reasons, I oppose the Chehalis River Basin Flood Damage Reduction Project. However, while this proposal and DEIS are unacceptable, it is important to acknowledge that the status quo is also untenable. We need a basin-wide approach to flood resiliency that benefits local communities, protects residents, and protects our wild fish and wildlife populations. I encourage the Chehalis Basin leaders to go back to the drawing board to develop a comprehensive solution that more effectively addresses the basin's challenges of flood control and fish recovery. Thank you for your work to create a brighter future for the Chehalis Basin and for your consideration of my comments.</p>

The Chehalis Basin communities deserve thoughtful, well-designed, and fiscally-sound solutions to address the basin's twin challenges of flood control and wild fish recovery. Unfortunately, the current dam proposal from the Chehalis Basin Flood Control District does not sufficiently address the flooding problem, would dramatically accelerate the decline of wild fish populations, and would cost taxpayers upwards of \$628 million. I am particularly concerned about spending \$628 million taxpayer dollars on a flood mitigation approach that will not excel at the one thing is intended to do – protect people from catastrophic flooding. According to the DEIS, in the event of another major flood event like 2007, the towns of Centralia and Chehalis would still experience serious flooding. Moreover, this lack of flood protection benefit is especially true the farther you move away from the proposed dam site because down-basin towns like Aberdeen would only experience 2 inches of flood reduction. I am also concerned about the irreparable harm the dam would have on wild fish and wildlife populations. This project would degrade critical spawning grounds for Chinook, coho salmon, and steelhead, further endangering these struggling fish populations that are vital to the basin's economy and environment. The project would also destroy hundreds of acres of quality forest, riparian habitat, and wetlands, which are essential for the diverse wildlife populations living in the Chehalis Basin and serve as critical migratory routes and connected habitat for wildlife such as elk and the endangered marbled murrelet. Additionally, the Draft Environmental Impact Statement fails to meet some basic requirements of the State Environmental Policy Act because it: 1) Lacks the mitigation measures to address the significant impacts the DEIS details, which hinders the public's ability to make informed decisions about the project. 2) Does not sufficiently analyze the least environmentally-harmful alternatives to the proposed dam. 3) Fails to properly acknowledge the full scale of environmental impacts the proposed dam would generate as well as the future impacts of the "expanded" version of this dam that is discussed in the DEIS. 4) Ignores the substantial impacts the proposed dam would have on the migratory routes and connected habitats wildlife need and fails to propose how these impacts could be mitigated. For all of these reasons, I oppose the Chehalis River Basin Flood Damage Reduction Project. However, while this proposal and DEIS are unacceptable, it is important to acknowledge that the status quo is also untenable. We need a basin-wide approach to flood resiliency that benefits local communities, protects residents, and protects our wild fish and wildlife populations. I encourage the Chehalis Basin leaders to go back to the drawing board to develop a comprehensive solution that more effectively addresses the basin's challenges of flood control and fish recovery. Thank you for your work to create a brighter future for the Chehalis Basin and for your consideration of my comments.</p>

I am also concerned about the irreparable harm the dam would have on wild fish and wildlife populations. This project would degrade critical spawning grounds for Chinook, coho salmon, and steelhead, further endangering these struggling fish populations that are vital to the basin's economy and environment. The project would also destroy hundreds of acres of quality forest, riparian habitat, and wetlands, which are essential for the diverse wildlife populations living in the Chehalis Basin and serve as critical migratory routes and connected habitat for wildlife such as elk and the endangered marbled murrelet. Additionally, the Draft Environmental Impact Statement fails to meet some basic requirements of the State Environmental Policy Act because it: 1) Lacks the mitigation measures to address the significant impacts the DEIS details, which hinders the public's ability to make informed decisions about the project. 2) Does not sufficiently analyze the least environmentally-harmful alternatives to the proposed dam. 3) Fails to properly acknowledge the full scale of environmental impacts the proposed dam would generate as well as the future impacts of the "expanded" version of this dam that is discussed in the DEIS. 4) Ignores the substantial impacts the proposed dam would have on the migratory routes and connected habitats wildlife need and fails to propose how these impacts could be mitigated. For all of these reasons, I oppose the Chehalis River Basin Flood Damage Reduction Project. However, while this proposal and DEIS are unacceptable, it is important to acknowledge that the status quo is also untenable. We need a basin-wide approach to flood resiliency that benefits local communities, protects residents, and protects our wild fish and wildlife populations. I encourage the Chehalis Basin leaders to go back to the drawing board to develop a comprehensive solution that more effectively addresses the basin's challenges of flood control and fish recovery. Thank you for your work to create a brighter future for the Chehalis Basin and for your consideration of my comments.</p>
2020-05-26 19:00:50 EST	Mike	Morgan	mmorgan777@gmail.com	978 Aaron Ave NE	Bainbridge Island	Washington	98110	Please Don't Dam the Chehalis	<p>I am writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. While I strongly support the state's efforts to mitigate the impacts of flooding in the Chehalis Basin, the proposal to build a large dam on the Chehalis River is not the right approach to address this serious issue.</p> <p>The river should run free to continue to provide habitat for our declining steelhead and salmon populations. We should stop building in flood prone areas.</p>

2020-05-26 19:05:45 EST	Don	Kneass	donkneass@gmail.com	1122 Grand Ave	Seattle	Washington	98122	Dams Kill Salmon	<p>I am writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. Year in and year out we read reports of the consequences of building dams on the viability of Salmon, Orcas, and the environment and the wildlife dependent on free flowing rivers. Yet nothing seems to get done to stop the ultimate extinction of these great and symbolic creatures. Lots of talk and money thrown at "mitigation" and yet the march to extinction continues unabated. Time to stop with the baloney and get real. Another dam will just hasten the end of Salmon as a viable species in our Eco- system. No Chehalis River Dam!RegardsDon Kneass,</p>
2020-05-26 19:40:59 EST	Charles	Hammerstad	chamerstad@aol.com	780 Portswood Dr	San Jose	California	95120	Please Don't Dam the Chehalis	<p>I am writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. While I strongly support the state's efforts to mitigate the impacts of flooding in the Chehalis Basin, the proposal to build a large dam on the Chehalis River is not the right approach to address this serious issue.</p> <p>The Chehalis Basin communities deserve thoughtful, well-designed, and fiscally-sound solutions to address the basin's twin challenges of flood control and wild fish recovery. Unfortunately, the current dam proposal from the Chehalis Basin Flood Control District does not sufficiently address the flooding problem, would dramatically accelerate the decline of wild fish populations, and would cost taxpayers upwards of \$628 million.</p> <p>I am particularly concerned about spending \$628 million taxpayer dollars on a flood mitigation approach that will not excel at the one thing is intended to do – protect people from catastrophic flooding. According to the DEIS, in the event of another major flood event like 2007, the towns of Centralia and Chehalis would still experience serious flooding. Moreover, this lack of flood protection benefit is especially true the farther you move away from the proposed dam site because down-basin towns like Aberdeen would only experience 2 inches of flood reduction.</p> <p>I am also concerned about the irreparable harm the dam would have on wild fish and wildlife populations. This project would degrade critical spawning grounds for Chinook, coho salmon, and steelhead, further endangering these struggling fish populations that are vital to the basin's economy and environment. Moreover, this lack of flood protection benefit is especially true the farther you move away from the proposed dam site because down-basin towns like Aberdeen would only experience 2 inches of flood reduction. I am also concerned about the irreparable harm the dam would have on wild fish and wildlife populations. This project would degrade critical spawning grounds for Chinook, coho salmon, and steelhead, further endangering these struggling fish populations that are vital to the basin's economy and environment. The project would also destroy hundreds of acres of quality forest, riparian habitat, and wetlands, which are essential for the diverse wildlife populations living in the Chehalis Basin and serve as critical migratory routes and connected habitat for wildlife such as elk and the endangered marbled murrelet. Additionally, the Draft Environmental Impact Statement fails to meet some basic requirements of the State Environmental Policy Act because it: 1) Lacks the mitigation measures to address the significant impacts the DEIS details, which hinders the public's ability to make informed decisions about the project. 2) Does not sufficiently analyze the least environmentally-harmful alternatives to the proposed dam. 3) Fails to properly acknowledge the full scale of environmental impacts the proposed dam would generate as well as the future impacts of the "expanded" version of this dam that is discussed in the DEIS. 4) Ignores the substantial impacts the proposed dam would have on the migratory routes and connected habitats wildlife need and fails to propose how these impacts could be mitigated. For all of these reasons, I oppose the Chehalis River Basin Flood Damage Reduction Project. However, while this proposal and DEIS are unacceptable, it is important to acknowledge that the status quo is also untenable. We need a basin-wide approach to flood resiliency that benefits local communities, protects residents, and protects our wild fish and wildlife populations. I encourage the Chehalis Basin leaders to go back to the drawing board to develop a comprehensive solution that more effectively addresses the basin's challenges of flood control and fish recovery. Thank you for your work to create a brighter future for the Chehalis Basin and for your consideration of my comments.</p>

2020-05-26 23:01:23 EST	Courtney	Jafferian	cjafferian3@gmail.com	4832 Sunset Dr. NW	Olympia	Washington	98502	Please Don't Dam the Chehalis	<p>I am writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. While I strongly support the state's efforts to mitigate the impacts of flooding in the Chehalis Basin, the proposal to build a large dam on the Chehalis River is not the right approach to address this serious issue. The Chehalis Basin communities deserve thoughtful, well-designed, and fiscally-sound solutions to address the basin's twin challenges of flood control and wild fish recovery. Unfortunately, the current dam proposal from the Chehalis Basin Flood Control District does not sufficiently address the flooding problem, would dramatically accelerate the decline of wild fish populations, and would cost taxpayers upwards of \$628 million. I am particularly concerned about spending \$628 million taxpayer dollars on a flood mitigation approach that will not excel at the one thing is intended to do – protect people from catastrophic flooding. According to the DEIS, in the event of another major flood event like 2007, the towns of Centralia and Chehalis would still experience serious flooding. Moreover, this lack of flood protection benefit is especially true the farther you move away from the proposed dam site because down-basin towns like Aberdeen would only experience 2 inches of flood reduction. I am also concerned about the irreparable harm the dam would have on wild fish and wildlife populations. This project would degrade critical spawning grounds for Chinook, coho salmon, and steelhead, further endangering these struggling fish populations that are vital to the basin's economy and environment. The project would also destroy hundreds of acres of quality forest, riparian habitat, and wetlands, which are essential for the diverse wildlife populations living in the Chehalis Basin and serve as critical migratory routes and connected habitat for wildlife such as elk and the endangered marbled murrelet. Additionally, the Draft Environmental Impact Statement fails to meet some basic requirements of the State Environmental Policy Act because it: 1) Lacks the mitigation measures to address the significant impacts the DEIS details, which hinders the public's ability to make informed decisions about the project. 2) Does not sufficiently analyze the least environmentally-harmful alternatives to the proposed dam. 3) Fails to properly acknowledge the full scale of environmental impacts the proposed dam would generate as well as the future impacts of the "expanded" version of this dam that is discussed in the DEIS. 4) Ignores the substantial impacts the proposed dam would have on the migratory routes and connected habitats wildlife need and fails to propose how these impacts could be mitigated. Additionally, the Draft Environmental Impact Statement fails to meet some basic requirements of the State Environmental Policy Act because it: 1) Lacks the mitigation measures to address the significant impacts the DEIS details, which hinders the public's ability to make informed decisions about the project. 2) Does not sufficiently analyze the least environmentally-harmful alternatives to the proposed dam. 3) Fails to properly acknowledge the full scale of environmental impacts the proposed dam would generate as well as the future impacts of the "expanded" version of this dam that is discussed in the DEIS. 4) Ignores the substantial impacts the proposed dam would have on the migratory routes and connected habitats wildlife need and fails to propose how these impacts could be mitigated. For all of these reasons, I oppose the Chehalis River Basin Flood Damage Reduction Project. However, while this proposal and DEIS are unacceptable, it is important to acknowledge that the status quo is also untenable. We need a basin-wide approach to flood resiliency that benefits local communities, protects residents, and protects our wild fish and wildlife populations. I encourage the Chehalis Basin leaders to go back to the drawing board to develop a comprehensive solution that more effectively addresses the basin's challenges of flood control and fish recovery. Thank you for your work to create a brighter future for the Chehalis Basin and for your consideration of my comments.</p>

2020-05-27 04:58:26 EST	Christopher Edwards	247opala@gmail.com	1659 Alencastre St	Honolulu	Hawaii	96816	Please Don't Dam the Chehalis	<p>I am writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. While I strongly support the state's efforts to mitigate the impacts of flooding in the Chehalis Basin, the proposal to build a large dam on the Chehalis River is not the right approach to address this serious issue. The Chehalis Basin communities deserve thoughtful, well-designed, and fiscally-sound solutions to address the basin's twin challenges of flood control and wild fish recovery. Unfortunately, the current dam proposal from the Chehalis Basin Flood Control District does not sufficiently address the flooding problem, would dramatically accelerate the decline of wild fish populations, and would cost taxpayers upwards of \$628 million. I am particularly concerned about spending \$628 million taxpayer dollars on a flood mitigation approach that will not excel at the one thing is intended to do – protect people from catastrophic flooding. According to the DEIS, in the event of another major flood event like 2007, the towns of Centralia and Chehalis would still experience serious flooding. Moreover, this lack of flood protection benefit is especially true the farther you move away from the proposed dam site because down-basin towns like Aberdeen would only experience 2 inches of flood reduction. I am also concerned about the irreparable harm the dam would have on wild fish and wildlife populations. This project would degrade critical spawning grounds for Chinook, coho salmon, and steelhead, further endangering these struggling fish populations that are vital to the basin's economy and environment. The project would also destroy hundreds of acres of quality forest, riparian habitat, and wetlands, which are essential for the diverse wildlife populations living in the Chehalis Basin and serve as critical migratory routes and connected habitat for wildlife such as elk and the endangered marbled murrelet. Additionally, the Draft Environmental Impact Statement fails to meet some basic requirements of the State Environmental Policy Act because it: 1) Lacks the mitigation measures to address the significant impacts the DEIS details, which hinders the public's ability to make informed decisions about the project. 2) Does not sufficiently analyze the least environmentally-harmful alternatives to the proposed dam. 3) Fails to properly acknowledge the full scale of environmental impacts the proposed dam would generate as well as the future impacts of the "expanded" version of this dam that is discussed in the DEIS. 4) Ignores the substantial impacts the proposed dam would have on the migratory routes and connected habitats wildlife need and fails to propose how these impacts could be mitigated. For all of these reasons, I oppose the Chehalis River Basin Flood Damage Reduction Project. However, while this proposal and DEIS are unacceptable, it is important to acknowledge that the status quo is also untenable. This project would degrade critical spawning grounds for Chinook, coho salmon, and steelhead, further endangering these struggling fish populations that are vital to the basin's economy and environment. The project would also destroy hundreds of acres of quality forest, riparian habitat, and wetlands, which are essential for the diverse wildlife populations living in the Chehalis Basin and serve as critical migratory routes and connected habitat for wildlife such as elk and the endangered marbled murrelet. Additionally, the Draft Environmental Impact Statement fails to meet some basic requirements of the State Environmental Policy Act because it: 1) Lacks the mitigation measures to address the significant impacts the DEIS details, which hinders the public's ability to make informed decisions about the project. 2) Does not sufficiently analyze the least environmentally-harmful alternatives to the proposed dam. 3) Fails to properly acknowledge the full scale of environmental impacts the proposed dam would generate as well as the future impacts of the "expanded" version of this dam that is discussed in the DEIS. 4) Ignores the substantial impacts the proposed dam would have on the migratory routes and connected habitats wildlife need and fails to propose how these impacts could be mitigated. For all of these reasons, I oppose the Chehalis River Basin Flood Damage Reduction Project. However, while this proposal and DEIS are unacceptable, it is important to acknowledge that the status quo is also untenable. We need a basin-wide approach to flood resiliency that benefits local communities, protects residents, and protects our wild fish and wildlife populations. I encourage the Chehalis Basin leaders to go back to the drawing board to develop a comprehensive solution that more effectively addresses the basin's challenges of flood control and fish recovery. Thank you for your work to create a brighter future for the Chehalis Basin and for your consideration of my comments.</p>

2020-05-27 11:07:10 EST	Aurora	Solla	wolva12@yahoo.com	4088 Cold Springs Rd	Trumansburg	New York	14886	Please Don't Dam the Chehalis	<p>I am writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. While I strongly support the state's efforts to mitigate the impacts of flooding in the Chehalis Basin, the proposal to build a large dam on the Chehalis River is not the right approach to address this serious issue. The Chehalis Basin communities deserve thoughtful, well-designed, and fiscally-sound solutions to address the basin's twin challenges of flood control and wild fish recovery. Unfortunately, the current dam proposal from the Chehalis Basin Flood Control District does not sufficiently address the flooding problem, would dramatically accelerate the decline of wild fish populations, and would cost taxpayers upwards of \$628 million. I am particularly concerned about spending \$628 million taxpayer dollars on a flood mitigation approach that will not excel at the one thing is intended to do – protect people from catastrophic flooding. According to the DEIS, in the event of another major flood event like 2007, the towns of Centralia and Chehalis would still experience serious flooding. Moreover, this lack of flood protection benefit is especially true the farther you move away from the proposed dam site because down-basin towns like Aberdeen would only experience 2 inches of flood reduction. I am also concerned about the irreparable harm the dam would have on wild fish and wildlife populations. This project would degrade critical spawning grounds for Chinook, coho salmon, and steelhead, further endangering these struggling fish populations that are vital to the basin's economy and environment. The project would also destroy hundreds of acres of quality forest, riparian habitat, and wetlands, which are essential for the diverse wildlife populations living in the Chehalis Basin and serve as critical migratory routes and connected habitat for wildlife such as elk and the endangered marbled murrelet. Additionally, the Draft Environmental Impact Statement fails to meet some basic requirements of the State Environmental Policy Act because it: 1) Lacks the mitigation measures to address the significant impacts the DEIS details, which hinders the public's ability to make informed decisions about the project. 2) Does not sufficiently analyze the least environmentally-harmful alternatives to the proposed dam. 3) Fails to properly acknowledge the full scale of environmental impacts the proposed dam would generate as well as the future impacts of the "expanded" version of this dam that is discussed in the DEIS. 4) Ignores the substantial impacts the proposed dam would have on the migratory routes and connected habitats wildlife need and fails to propose how these impacts could be mitigated. For all of these reasons, I oppose the Chehalis River Basin Flood Damage Reduction Project. However, while this proposal and DEIS are unacceptable, it is important to acknowledge that the status quo is also untenable. 2020-05-27 11:47:42 EST	Tom	Anderson	artist402@comast.net	402 summit lake sh rd	olympia	Washington	98502	Please Don't Dam the Chehalis	I am writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. Unfortunately, the current dam proposal from the Chehalis Basin Flood Control District does not sufficiently address the flooding problem, would dramatically accelerate the decline of wild fish populations, and would cost taxpayers upwards of \$628 million. There seems to be no assessment of the seismic geologic risk in the event of earthquakes and the problems of silt accumulation not only behind the dam but downriver in the flood plain. I am also concerned about the damage the dam would have on wild fish and wildlife populations. This project would negatively impact spawning grounds for Chinook, coho salmon, and steelhead, further endangering these important fish populations that are vital to the basin's economy and environment. The project would also destroy hundreds of acres of quality forest, riparian habitat, and wetlands. Last but not least is the lack of respect this proposal infers for the Chehalis and Quinault native treaty rights, their sacred grounds and fishing heritage. I oppose the Chehalis River Basin Flood Damage Reduction Project. I encourage the Chehalis Basin leaders to develop a comprehensive solution that more effectively addresses the basin's challenges of flood control and fish recovery. For example, use the funds proposed for building the dam to buy out properties and discontinue permitting new construction along I-5 in a flood plain. Thank you for your work to create a brighter future for the Chehalis Basin and for your consideration of my comments.
2020-05-27 12:08:43 EST	Devin	Peterson	devinpeterson1973@gmail.com	935 north 2 street	Pe ELL, Washington	Washington	98572	Please Don't Dam the Chehalis	I oppose this dam project do to the fact I live around 3 miles below the projected dam site. With the recent failure of the earth-in dams in Michigan it makes me Leary about living below1. Also this dam is designed to do 1 thing, to prevent I 5 from shutting done, also the business in the Chehalis and Centralia area from flooding. These businesses that I'm referring to where built in the flood plane to begin with, for example if you have a 5 gallon bucket, half full of water and you add a rock in the bucket , where's the water go? Up right! Keep adding rocks the water keeps going up, so the problem began a while back with the flood plane being filled in, now it's Pe ELLs problem to fix it. Also the area where the dam is projected to be placed at is on unstable ground, Weyerhaeuser has a road that's in the area that's been fixed numerous times due to erosion along that area. I'm also an avid fisherman along this river and I can't imagine what kind of effects this would have on the upper river steelhead spawning grounds. In a time where people want to pull dams out of the rivers you are wanting to put 1 in, not logical. Find another way to fix the I 5 problem, the upper chehalis dam isn't the answer. Put your research \$ to better use!! I know you've spent plenty of it! Thanks for you time.

2020-05-27 12:22:41 EST	Jacob	Murray	MURRAY2015@GMAIL.COM	435 Dexter ave north, Apartment 629	Seattle	Washington	98109	Please Don't Dam the Chehalis	<p>I am writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. This project would degrade critical spawning grounds for Chinook, coho salmon, and steelhead, further endangering these struggling fish populations that are vital to the basin's economy and environment. The project would also destroy hundreds of acres of quality forest, riparian habitat, and wetlands, which are essential for the diverse wildlife populations living in the Chehalis Basin and serve as critical migratory routes and connected habitat for wildlife such as elk and the endangered marbled murrelet. Additionally, the Draft Environmental Impact Statement fails to meet some basic requirements of the State Environmental Policy Act because it: 1) Lacks the mitigation measures to address the significant impacts the DEIS details, which hinders the public's ability to make informed decisions about the project. 2) Does not sufficiently analyze the least environmentally-harmful alternatives to the proposed dam. 3) Fails to properly acknowledge the full scale of environmental impacts the proposed dam would generate as well as the future impacts of the "expanded" version of this dam that is discussed in the DEIS. 4) Ignores the substantial impacts the proposed dam would have on the migratory routes and connected habitats wildlife need and fails to propose how these impacts could be mitigated. For all of these reasons, I oppose the Chehalis River Basin Flood Damage Reduction Project. However, while this proposal and DEIS are unacceptable, it is important to acknowledge that the status quo is also untenable. We need a basin-wide approach to flood resiliency that benefits local communities, protects residents, and protects our wild fish and wildlife populations. I encourage the Chehalis Basin leaders to go back to the drawing board to develop a comprehensive solution that more effectively addresses the basin's challenges of flood control and fish recovery. Thank you for your work to create a brighter future for the Chehalis Basin and for your consideration of my comments.</p>

2020-05-27 13:22:04 EST	Wesley	Smith	wandt@me.con	8629 Glenroy Way	Sacramento	California	95826	Please Don't Dam the Chehalis	<p>I am writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. While I strongly support the state's efforts to mitigate the impacts of flooding in the Chehalis Basin, the proposal to build a large dam on the Chehalis River is not the right approach to address this serious issue. The Chehalis Basin communities deserve thoughtful, well-designed, and fiscally-sound solutions to address the basin's twin challenges of flood control and wild fish recovery. Unfortunately, the current dam proposal from the Chehalis Basin Flood Control District does not sufficiently address the flooding problem, would dramatically accelerate the decline of wild fish populations, and would cost taxpayers upwards of \$628 million. I am particularly concerned about spending \$628 million taxpayer dollars on a flood mitigation approach that will not excel at the one thing is intended to do – protect people from catastrophic flooding. According to the DEIS, in the event of another major flood event like 2007, the towns of Centralia and Chehalis would still experience serious flooding. Moreover, this lack of flood protection benefit is especially true the farther you move away from the proposed dam site because down-basin towns like Aberdeen would only experience 2 inches of flood reduction. I am also concerned about the irreparable harm the dam would have on wild fish and wildlife populations. This project would degrade critical spawning grounds for Chinook, coho salmon, and steelhead, further endangering these struggling fish populations that are vital to the basin's economy and environment. The project would also destroy hundreds of acres of quality forest, riparian habitat, and wetlands, which are essential for the diverse wildlife populations living in the Chehalis Basin and serve as critical migratory routes and connected habitat for wildlife such as elk and the endangered marbled murrelet. Additionally, the Draft Environmental Impact Statement fails to meet some basic requirements of the State Environmental Policy Act because it: 1) Lacks the mitigation measures to address the significant impacts the DEIS details, which hinders the public's ability to make informed decisions about the project. 2) Does not sufficiently analyze the least environmentally-harmful alternatives to the proposed dam. 3) Fails to properly acknowledge the full scale of environmental impacts the proposed dam would generate as well as the future impacts of the "expanded" version of this dam that is discussed in the DEIS. 4) Ignores the substantial impacts the proposed dam would have on the migratory routes and connected habitats wildlife need and fails to propose how these impacts could be mitigated. For all of these reasons, I oppose the Chehalis River Basin Flood Damage Reduction Project.
