

About this Document

This document contains comments submitted on the SEPA Draft Environmental Impact Statement (EIS) for the proposed Chehalis River Basin Flood Damage Reduction Project from February 27 to May 27, 2020.

All comments are valued equally. Comments have been arranged in categories solely for ease of access and downloading or searching the documents.

All comments will be considered for the final EIS and responses to substantive comments will be included in the final report.

4/2/2020	Allen, Tyler	White Salmon	WA	98672-0428	Dams aren't the answer. While flood control measures are understandable and necessary, the onus is on the individual to reconcile the risk of living in a flood-prone region and act accordingly without unduly affecting anadromous fish populations and the greater riparian ecosystem. As a whitewater boater who enjoys the recreational opportunities Washington's rivers provide, I am writing to comment on the State Environmental Policy Act Draft Environmental Impact Statement for the Proposed Chehalis River Basin Flood Damage Reduction Project. I oppose the current plan to build a dam on the upper Chehalis River. In addition to impacts on salmon habitat and overall river health that will be degraded with construction of a dam on the Chehalis River, recreational opportunities on the river will be lost. I concur with the analysis in the SEPA document that a new dam on the Chehalis River would result in a significant and unavoidable adverse environmental impact to recreation with 'permanent loss of access to 14 miles of kayaking and 13 miles of recreational riverbank fishing.' The Chehalis River basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal will not comprehensively address either problem. The proposed dam is not fiscally responsible, benefits too few, and has unacceptable impacts. I urge you to work towards solutions that do not rely on the failed approaches of the last century we know are bad for fish and bad for the environment.
4/3/2020	Almquist, Jon	Seattle	WA	98126	As a whitewater boater who enjoys the recreational opportunities Washington's rivers provide, I am writing to comment on the State Environmental Policy Act Draft Environmental Impact Statement for the Proposed Chehalis River Basin Flood Damage Reduction Project. I oppose the current plan to build a dam on the upper Chehalis River. I've been kayaking Washington's rivers for over 35 years, and up until the recent land restrictions implemented by Weyerhaeuser, the many kayak 'runs' on the Chehalis River upstream of Pe Ell were some of my favorite rainy season / fall and winter paddling options. While the access restrictions are hopefully temporary, any form of dam would forever end paddling and other river recreation on this amazing and unique resource. In addition to kayaking, impacts on salmon habitat and overall river health will be degraded with construction of a dam on the Chehalis River, and as noted above all recreational opportunities on the river will be lost. I concur with the analysis in the SEPA document that a new dam on the Chehalis River would result in a significant and unavoidable adverse environmental impact to recreation with 'permanent loss of access to 14 miles of kayaking and 13 miles of recreational riverbank fishing.' The Chehalis River basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal will not comprehensively address either problem. The proposed dam is not fiscally responsible, benefits too few, and has unacceptable impacts. I urge you to work towards solutions that do not rely on the failed approaches of the last century we know are bad for fish and bad for the environment.
5/27/2020	Anderson, Sara	Seattle	WA	98155	As a whitewater boater who enjoys the recreational opportunities Washington's rivers provide, I am writing to comment on the State Environmental Policy Act Draft Environmental Impact Statement for the Proposed Chehalis River Basin Flood Damage Reduction Project. I oppose the current plan to build a dam on the upper Chehalis River. In addition to impacts on salmon habitat and overall river health that will be degraded with construction of a dam on the Chehalis River, recreational opportunities on the river will be lost. It is illogical that during a time of positive change in protecting animals, the environment, and recreational enjoyment, efforts counteracting this would be undergone. How much money is being spent currently to restore lands? And now money is being allocated to create this exact destruction elsewhere. I am opposed to the 'not in my backyard' mentality-- this earth should feel like the backyard of each individual, and opportunities for all to experience and enjoy it should be preserved. Not just those today, but future generations that are likewise negatively impacted by actions like this. I concur with the analysis in the SEPA document that a new dam on the Chehalis River would result in a significant and unavoidable adverse environmental impact to recreation with 'permanent loss of access to 14 miles of kayaking and 13 miles of recreational riverbank fishing.' If you do not partake in these activities, this loss may seem small. I assure you it isn't. This type of recreation benefits the health (mental, emotional, and physical) and happiness of countless individuals. It should not be ignored or diminished. The Chehalis River basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal will not comprehensively address either problem. The proposed dam is not fiscally responsible, benefits too few, and has unacceptable impacts. Please, please rethink your actions. Stop wasting hard earned money on foolhardy actions. I urge you to work towards solutions that do not rely on the failed approaches of the last century we know are bad for fish and bad for the environment. We can be better! Bright minds should be utilized to achieve results that benefit all rather than the few. This proposed action is a microcosm of what's occurring globally. It is significant-- and I urge you to move in the right direction, and be on the right side of history, rather than plod on the path of those misguided souls that came before you.

4/3/2020	Brame, Scott	Clemson	SC	29631-1951	I oppose the plan to build a dam on the upper Chehalis River and wish to enter my comments on the State Environmental Policy Act Draft Environmental Impact Statement for the Proposed Chehalis River Basin Flood Damage Reduction Project. As a whitewater paddler and fisherman who has enjoyed Washington's rivers, I see nothing good coming from this project. This proposal falls back on outdated modes of solving social problems that have been shown to cause more problems than they solve. We should be taking down dams, NOT building more! The current dam proposal does not address flooding and salmon/steelhead declines in a holistic way. This proposal does not adequately acknowledge and account for the long term impacts from significant reductions in water quality, changes in sediment transport/deposition, changes in fish migrations and reproduction, modifications to riparian and floodplain habitat and the organisms that rely on this habitat. In short, the proposed dam is not fiscally responsible, benefits too few, and has unacceptable impacts. As it states in the SEPA document, a new dam on the Chehalis River will result in a significant and unavoidable adverse environmental impact to recreation with 'permanent loss of access to 14 miles of kayaking and 13 miles of recreational riverbank fishing.' This is unacceptable. The consensus among river ecologists is that dams are the single greatest cause of the decline of river ecosystems. There are better solutions. History has shown that rising flood costs, despite increased spending on flood protection, has forced the United States to rethink long-held flood management policies that focused on dams and other engineered structures. New approaches focus on integrated management of the watershed, river, and floodplain, and incorporates nonstructural strategies. I thank you for the opportunity to comment.
4/3/2020	Branstetter, Kevin	Applegate	CA	95703-0383	
4/19/2020	Brodigan, Dee	Port Orchard	WA	98367	

4/23/2020	Brower, Paul	Everett	WA	98203-3458	As a whitewater boater who enjoys the recreational opportunities Washington's rivers provide, I am writing to comment on the State Environmental Policy Act Draft Environmental Impact Statement for the Proposed Chehalis River Basin Flood Damage Reduction Project. I oppose the current plan to build a dam on the upper Chehalis River. I am also a fisherman and scuba diver and have seen the fish populations reduced significantly in the last several decades. With more people coming into the area and using these resources I believe we should be protecting the migrating fish habitat for the health of the rivers and Puget Sound and protecting river access for the recreation that draws people to this area. I concur with the analysis in the SEPA document that a new dam on the Chehalis River would result in a significant and unavoidable adverse environmental impact to recreation with 'permanent loss of access to 14 miles of kayaking and 13 miles of recreational riverbank fishing.' The Chehalis River basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal will not comprehensively address either problem. The proposed dam is not fiscally responsible, benefits too few, and has unacceptable impacts. I urge you to work towards solutions that do not rely on the failed approaches of the last century we know are bad for fish and bad for the environment.

Subject: Comments on Proposed Chehalis River Dam
Date: Thursday, April 2, 2020 7:56:31 AM

Dear Program Manager Gordon White,

Dams aren't the answer. While flood control measures are understandable and necessary, the onus is on the individual to reconcile the risk of living in a flood-prone region and act accordingly without unduly affecting anadromous fish populations and the greater riparian ecosystem.

As a whitewater boater who enjoys the recreational opportunities Washington's rivers provide, I am writing to comment on the State Environmental Policy Act Draft Environmental Impact Statement for the Proposed Chehalis River Basin Flood Damage Reduction Project. I oppose the current plan to build a dam on the upper Chehalis River.

In addition to impacts on salmon habitat and overall river health that will be degraded with construction of a dam on the Chehalis River, recreational opportunities on the river will be lost. I concur with the analysis in the SEPA document that a new dam on the Chehalis River would result in a "significant and unavoidable adverse environmental impact" to recreation with "permanent loss of access to 14 miles of kayaking and 13 miles of recreational riverbank fishing."

The Chehalis River basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal will not comprehensively address either problem. The proposed dam is not fiscally responsible, benefits too few, and has unacceptable impacts.

I urge you to work towards solutions that do not rely on the failed approaches of the last century we know are bad for fish and bad for the environment.

Sincerely,
Tyler Allen

I concur with the analysis in the SEPA document that a new dam on the Chehalis River would result in a "significant and unavoidable adverse environmental impact" to recreation with "permanent loss of access to 14 miles of kayaking and 13 miles of recreational riverbank fishing."

The Chehalis River basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal will not comprehensively address either problem. The proposed dam is not fiscally responsible, benefits too few, and has unacceptable impacts.

I urge you to work towards solutions that do not rely on the failed approaches of the last century we know are bad for fish and bad for the environment.

Sincerely,
Kiira Antenucci

Dear Program Manager Gordon White,

As a whitewater boater who enjoys the recreational opportunities Washington's rivers provide, I am writing to comment on the State Environmental Policy Act Draft Environmental Impact Statement for the Proposed Chehalis River Basin Flood Damage Reduction Project. I oppose the current plan to build a dam on the upper Chehalis River.

I am also a fisherman and scuba diver and have seen the fish populations reduced significantly in the last several decades. With more people coming into the area and using these resources I believe we should be protecting the migrating fish habitat for the health of the rivers and Puget Sound and protecting river access for the recreation that draws people to this area.

I concur with the analysis in the SEPA document that a new dam on the Chehalis River would result in a "significant and unavoidable adverse environmental impact" to recreation with "permanent loss of access to 14 miles of kayaking and 13 miles of recreational riverbank fishing."

The Chehalis River basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Dear Program Manager Gordon White,

I agree strongly with the statements below and would like to pointedly voice my concern of how such dams destroy the very places we love and strive to protect for future generations. From the rivers and canyons of the desert southwest to the deep wild places of China I've seen too many beloved places drown with a variety of adverse effects. I plead, DO NOT build this dam. We are the stewards of this land and have better tools at hand to protect and revive this river basin for a controlled and healthy watershed.

As a whitewater boater who enjoys the recreational opportunities Washington's rivers provide, I am writing to comment on the State Environmental Policy Act Draft Environmental Impact Statement for the Proposed Chehalis River Basin Flood Damage Reduction Project. I oppose the current plan to build a dam on the upper Chehalis River.

Date: Friday, April 3, 2020 5:54:14 AM

Dear Program Manager Gordon White,

As a whitewater boater who enjoys the recreational opportunities Washington's rivers provide, I am writing to comment on the State Environmental Policy Act Draft Environmental Impact Statement for the Proposed Chehalis River Basin Flood Damage Reduction Project. I oppose the current plan to build a dam on the upper Chehalis River.

In addition to impacts on salmon habitat and overall river health that will be degraded with construction of a dam on the Chehalis River, recreational opportunities on the river will be lost. I concur with the analysis in the SEPA document that a new dam on the Chehalis River would result in a "significant and unavoidable adverse environmental impact" to recreation with "permanent loss of access to 14 miles of kayaking and 13 miles of recreational riverbank fishing."

The Chehalis River basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal will not comprehensively address either problem. The proposed dam is not fiscally responsible, benefits too few, and has unacceptable impacts.

I urge you to work towards solutions that do not rely on the failed approaches of the last century we know are bad for fish and bad for the environment.

Sincerely,
E Shannon Crosswhite

Dear Program Manager Gordon White,

The last thing that the wettest area of the country needs is more dams. Please stop constructing Dams. If the stupid corps of engineering wants work, have them take dams down. Or maybe they could repair some roads, bridges and infrastructure first. Thanks

As a whitewater boater who enjoys the recreational opportunities Washington's rivers provide, I am writing to comment on the State Environmental Policy Act Draft Environmental Impact Statement for the Proposed Chehalis River Basin Flood Damage Reduction Project. Dear Program Manager Gordon White,

As a whitewater boater who enjoys the recreational opportunities Washington's rivers provide, I am writing to comment on the State Environmental Policy Act Draft Environmental Impact Statement for the Proposed Chehalis River Basin Flood Damage Reduction Project. I oppose the current plan to build a dam on the upper Chehalis River.

In addition to impacts on salmon habitat and overall river health that will be degraded with construction of a dam on the Chehalis River, recreational opportunities on the river will be lost. I concur with the analysis in the SEPA document that a new dam on the Chehalis River would result in a "significant and unavoidable adverse environmental impact" to recreation with "permanent loss of access to 14 miles of kayaking and 13 miles of recreational riverbank fishing."

The Chehalis River basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal will not comprehensively address either problem. The proposed dam is not fiscally responsible, benefits too few, and has unacceptable impacts.

I urge you to work towards solutions that do not rely on the failed approaches of the last century we know are bad for fish and bad for the environment.

Sincerely,
Clara Holder

Dear Program Manager Gordon White,

I'm a whitewater kayaker who loves Washington's rivers. I'm commenting on the State Environmental Policy Act Draft Environmental Impact Statement for the Proposed Chehalis River Basin Flood Damage Reduction Project. I oppose the current plan to build a dam on the upper Chehalis River.

We will lose access to some of Washington's best whitewater recreation. I agree with the analysis in the SEPA document that a new dam on the Chehalis River would result in a "significant and unavoidable adverse environmental impact" to recreation with "permanent loss of access to 14 miles of kayaking and 13 miles of recreational riverbank fishing."

Additionally, the construction of a dam on the Chehalis River will decrease salmon habitat and overall river health. The Chehalis River basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal will not comprehensively address either problem. The proposed dam is not fiscally responsible, benefits too few, and has unacceptable impacts.

Dear Program Manager Gordon White,

As a whitewater boater who enjoys the recreational opportunities Washington's rivers provide, I am writing to comment on the State Environmental Policy Act Draft Environmental Impact Statement for the Proposed Chehalis River Basin Flood Damage Reduction Project. I oppose the current plan to build a dam on the upper Chehalis River.

In addition to impacts on salmon habitat and overall river health that will be degraded with construction of a dam on the Chehalis River, recreational opportunities on the river will be lost. I concur with the analysis in the SEPA document that a new dam on the Chehalis River would result in a "significant and unavoidable adverse environmental impact" to recreation with "permanent loss of access to 14 miles of kayaking and 13 miles of recreational riverbank fishing."

The Chehalis River basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal will not comprehensively address either problem. The proposed dam is not fiscally responsible, benefits too few, and has unacceptable impacts.

I urge you to work towards solutions that do not rely on the failed approaches of the last century we know are bad for fish and bad for the environment.

Sincerely,
John Mallery

I urge you to work towards solutions that do not rely on the failed approaches of the last century we know are bad for fish and bad for the environment.

My husband and I had the opportunity to paddle this section of river back in 2011. Since the road is closed to motor vehicles, we had to hike our raft 13 miles in on a hand-cart, including through a few road wash-outs. It was a grueling day, but the paddle made it all worth it. This section of river is stunning! Two beautiful canyons, each with their own unique features and set of quality whitewater rapids. This run would instantly be a classic if there were access. And even if the access remains closed, I believe there is immense value in the varied ecosystem of this section and the recreational opportunities for those paddlers who are willing to work a little harder for it.

This is a quote from my trip report, "And in the final stretch of river before Pe Ell, the Chehalis carves one of the most beautiful green mossy corridors I've ever seen. Floating through that hallway of waterfalls, soft emerald blankets of moss and great curtains of ivy hanging off the cliffs, I wanted that moment to last forever. "

Please help protect this beautiful place. Thank you for your time and consideration.

Sincerely,
Kira Marley

I oppose the current plan to build a dam on the upper Chehalis River.

In addition to impacts on salmon habitat and overall river health that will be degraded with construction of a dam on the Chehalis River, recreational opportunities on the river will be lost. I concur with the analysis in the SEPA document that a new dam on the Chehalis River would result in a "significant and unavoidable adverse environmental impact" to recreation with "permanent loss of access to 14 miles of kayaking and 13 miles of recreational riverbank fishing."

The Chehalis River basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal will not comprehensively address either problem. The proposed dam is not fiscally responsible, benefits too few, and has unacceptable impacts.

I urge you to work towards solutions that do not rely on the failed approaches of the last century we know are bad for fish and bad for the environment.

Sincerely,
Margret Powers

Dear Program Manager Gordon White,

Hi Gordon,

I love the PNW and I am a whitewater boater. I've made many memories with friends and family on scenic and wild rivers. My love of paddling stems from trips down uninterrupted stretches of flowing rapids, where nature is unencumbered from the sounds of man's technologies and the tonal dredging of greywashed cement structures. This beauty, while seemingly fleeting in these times, is priceless. I understand aesthetics have to be balanced with the needs of society. However this damn is a step in the wrong direction. It does not help to reduce flooding appropriately, it will damage ecology and, for people like it will only stop me from traveling to and recreating in Washington.

As a whitewater boater who enjoys the recreational opportunities Washington's rivers provide, I am writing to comment on the State Environmental Policy Act Draft Environmental Impact Statement for the Proposed Chehalis River Basin Flood Damage Reduction Project. I oppose the current plan to build a dam on the upper Chehalis River.

In addition to impacts on salmon habitat and overall river health that will be degraded with construction of a dam on the Chehalis River, recreational opportunities on the river will be lost. I concur with the analysis in the SEPA document that a new dam on the Chehalis River would result in a "significant and unavoidable adverse environmental impact" to recreation with "permanent loss of access to 14 miles of kayaking and 13 miles of recreational riverbank fishing."

The Chehalis River basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal will not comprehensively address either problem. The proposed dam is not fiscally responsible, benefits too few, and has unacceptable impacts.

I urge you to work towards solutions that do not rely on the failed approaches of the last century we know are bad for fish and bad for the environment.

Dear Program Manager Gordon White,

As a whitewater boater who enjoys the recreational opportunities Washington's rivers provide, I am writing to comment on the State Environmental Policy Act Draft Environmental Impact Statement for the Proposed Chehalis River Basin Flood Damage Reduction Project. I oppose the current plan to build a dam on the upper Chehalis River.

In addition to impacts on salmon habitat and overall river health that will be degraded with construction of a dam on the Chehalis River, recreational opportunities on the river will be lost. I concur with the analysis in the SEPA document that a new dam on the Chehalis River would result in a "significant and unavoidable adverse environmental impact" to recreation with "permanent loss of access to 14 miles of kayaking and 13 miles of recreational riverbank fishing."

The Chehalis River basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal will not comprehensively address either problem. The proposed dam is not fiscally responsible, benefits too few, and has unacceptable impacts.

I urge you to work towards solutions that do not rely on the failed approaches of the last century we know are bad for fish and bad for the environment.

Sincerely,
Rahul Subramanian

I oppose the current plan to build a dam on the upper Chehalis River.

I live in Washington for the whitewater. 13 miles of Class III whitewater is a special, uncommon natural asset. I would be appalled if we were to lose this recreational whitewater stretch.

In addition to impacts on salmon habitat and overall river health that will be degraded with construction of a dam on the Chehalis River, recreational opportunities on the river will be lost. I concur with the analysis in the SEPA document that a new dam on the Chehalis River would result in a "significant and unavoidable adverse environmental impact" to recreation with "permanent loss of access to 14 miles of kayaking and 13 miles of recreational riverbank fishing."

I would also like to add that from the research that I have read dam's have a lot of adverse long term affects on the environment that are more subtle than destroying native fish runs and destroying habitat. It has recently come to my attention that the river silt that is being held behind these dams used to help keep coast lines stable. I find it hard to believe that the state of Washington is even considering allowing as new dam to be constructed regardless of the reason.

Very Sincerely

Jim Hunter

Dear Program Manager Gordon White,

As a whitewater boater who enjoys the recreational opportunities Washington's rivers provide, I am writing to comment on the State Environmental Policy Act Draft Environmental Impact Statement for the Proposed Chehalis River Basin Flood Damage Reduction Project. I very strongly oppose the current plan to build a dam on the upper Chehalis River.

In addition to impacts on salmon habitat and overall river health that will be degraded with construction of a dam on the Chehalis River, recreational opportunities on the river will be lost. I concur with the analysis in the SEPA document that a new dam on the Chehalis River would result in a "significant and unavoidable adverse environmental impact" to recreation with "permanent loss of access to 14 miles of kayaking and 13 miles of recreational riverbank fishing."

The Chehalis River basin is clearly in need of a comprehensive strategy to address both heavy flooding and salmon and steelhead declines. Unfortunately the current dam proposal will not comprehensively address either problem. The proposed dam is not fiscally responsible, benefits too few, and has unacceptable impacts. We live in a time where many dams are being removed from rivers in the Northwest (e.g. Condit, Elwah and proposed plans in the Klamath basin) and therefore building a new dam in this era would not only send the wrong message, it is behind the times. It does not make sense to build large dams in the PNW anymore, that time has passed. As noted, comprehensive basin management plans involving multiple stakeholders should by all means be undertaken but large dam projects have passed their heyday. We have seen the long term ecological and recreational opportunities lost to large dam projects in the Northwest for decades now and a renewal of that approach is antiquated and illogical. Please consider pursuing other more reasonable (both cost wise and in terms of impacts) approaches before proceeding with this plan.

I urge you to work towards solutions that do not rely on the failed approaches of the last century we know are bad for fish and bad for the environment.

Sincerely,
Ben Roberts-Pierel

What about a fish habitat friendly dam? I think this whole project needs to be overhauled to take the environment into consideration. If this is implemented, fish populations will decrease. That will have a food chain effect and could even end up affecting WA's beautiful Orcas! Climate change is real. WA needs to be at the forefront of caring for the environment in this crazy time.

Sincerely,
Katelyn Younger

I know we have lots of issues these days and COVID-19 has been a magnifying glass for many of these issues. What it has shown us is that deep down what matters are basic human rights and clean healthy water is one of those. Lets learn from history and stop doing things that go against mother nature. Why do humans keep trying so hard to mess up a good thing. Rivers should be free and humans are clever enough to create intelligent harmonious solutions to energy production that doesn't harm nature and hurt recreation and sport all at once. Please do what is right and what you know you need to do. Say no to this dam, and sleep better at night knowing you helped stop this atrocity.

Sincerely,
Eliza Woodworth

Seems to me, for that kinda money, yawl could come up with a better plan...One that would keep the dwindling salmon migration at a maximum & to expand salmon populations,(ie fish ladder). Two, a series of low impact flood mitigation zones which not only allow for the FULL RESTORATION of taxpayer RECREATIONAL USE of the river, but tree,..mitigate ACTUAL flooding by giving the water somewhere to go for a short time in smaller pools that everybody might fill up come spring or storm. thank you.

Date: Friday, May 8, 2020 10:17:00 PM

Dear Program Manager Gordon White,

I am writing to comment on the State Environmental Policy Act Draft Environmental Impact Statement for the Proposed Chehalis River Basin Flood Damage Reduction Project. I oppose the current plan to build a dam on the upper Chehalis River. It will not solve the issue of flooding but it will reduce recreational whitewater access, water quality, and fish populations. Dams are an outdated solution to a complex problem of flooding, that would be better addressed with policies that assist current landowners, reduce new floodplain development, enhance natural floodplain capacity, and promote the public use of this healthy free-flowing river.

I currently live in California, but kayakers have a way of crossing state borders, with boaters from Washington and Oregon traveling to paddle our granite slides and boaters from here traveling up to your beautiful forested rivers further north. Freely flowing rivers are rare gems across the West and a public resource that should be preserved for generations to come.

Thank you for your consideration.

Sincerely,
Erin Calfee

Date	Contact Title	Advocate First Name	Advocate Last Name	Advocate City	Advocate State	Advocate Zip	Advocate Email Address	Message Subject	Message Body
2020-04-29 20:58:59	Chehalis Basin Flood Damage Reduction Project	Toni	Aal	Kent	WA	98042	laal7@aol.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead, Washington's beleaguered State Fish.</p> <p>Rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Toni Aal 14055 SE 202nd St Kent, WA 98042</p>

<p>2020-05-01 12:22:19</p>	<p>Chehalis Basin Flood Damage Reduction Project</p>	<p>Sophie</p>	<p>Aanerud</p>	<p>Seattle</p>	<p>WA</p>	<p>98105</p>	<p>orcasaanerud@gmail.com</p>	<p>Comments on proposed Chehalis River Dam DEIS</p>	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead.</p> <p>In addition to serving as critical fish habitat, rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation. On top of unacceptable impacts to wild salmon and steelhead.</p> <p>While a massive new dam is unacceptable, so is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Sophie Aanerud 4706 20th Ave NE Seattle, WA 98105</p>

This project would DESTROY ECOSYSTEMS: hundreds of acres of quality forest, riparian habitat, and wetlands. It would DEGRADE IMPORTANT SPAWNING GROUNDS for the Chinook and coho salmon and steelhead that THE PUBLIC WANTS DESPERATELY TO PROTECT.</p> <p>Also, the Chehalis and Skookumchuck rivers and nearby riparian areas are NECESSARY so wildlife can move around, find food and mates, and seek new places to live when climate disruption forces them to leave their traditional homes.</p> <p>Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation. On top of unacceptable impacts to wild salmon and steelhead.</p> <p>While a massive new dam is unacceptable, so is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Rylan Anderson</p> <p>Seattle, WA 98133</p>

2020-05-03 14:58:20	Chehalis Basin Flood Damage Reduction Project	Kaylee	Andrews	Seattle	WA	98119	kaylee34@gmail.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead.</p> <p>In addition to serving as critical fish habitat, rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation. On top of unacceptable impacts to wild salmon and steelhead.</p> <p>While a massive new dam is unacceptable, so is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead, Washington's beleaguered State Fish.</p> <p>Rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Shary B 1950 Alaskan Way Seattle, WA 98101</p>

Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Anna Bascom 17970 Thompson PI NE Poulsbo, WA 98370</p>

Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation. On top of unacceptable impacts to wild salmon and steelhead.</p> <p>While a massive new dam is unacceptable, so is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Seth Berg 410 E Alexander St Yacolt, WA 98675</p>

2020-04-29 20:27:15	Chehalis Basin Flood Damage Reduction Project	Richard	Bergner	Anacortes	WA	98221	fidalgowildlifehabitat@gmail.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead, Washington's beleaguered State Fish.</p> <p>Rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, WILLIAM BOOTH 450 Wood Ave SW Bainbridge Island, WA 98110</p>

2020-04-29 20:19:04	Chehalis Basin Flood Damage Reduction Project	WILLIAM	BOOTH	Bainbridge Island	WA	98110	bbbooth@msn.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>m\Maybe you should deal with the underlying problem rather than the symptom - flooding. Maybe the land use in the upper basin is the cause of the flooding: over harvesting forest; too much land cleared; too many acres in hardened roads and roofs; too much channelization instead of allowing flooding to occur in low areas of the headwaters.</p> <p>Just do not offer us only an engineered solution to the symptoms.</p> <p>Regards, WILLIAM BOOTH 450 Wood Ave SW Bainbridge Island, WA 98110</p>
2020-05-03 13:21:44	Chehalis Basin Flood Damage Reduction Project	James	Bracher	Kirkland	WA	98033	jimbracher@gmail.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>The days of big dams are over. While some people remain committed to 19th century technologies, we have better options today. Wind and solar are wiser investments. Less impact on the environment, more resilient, more flexible, and much more.</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead.</p> <p>In addition to serving as critical fish habitat, rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation. On top of unacceptable impacts to wild salmon and steelhead.</p> <p>While a massive new dam is unacceptable, so is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. 2020-04-29 21:09:47	Chehalis Basin Flood Damage Reduction Project	Anita	Bryant	Seattle	WA	98105	feathy@hotmail.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead, Washington's beleaguered State Fish.</p> <p>Rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Anita Bryant 2110 NE Park Rd Seattle, WA 98105</p>

2020-04-30 06:52:36	Chehalis Basin Flood Damage Reduction Project	Rebecca	Canright	Rockport	WA	98283	rebeccagroovypeace@gmail.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead, Washington's beleaguered State Fish.</p> <p>Rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Rebecca Canright 11589 Martin Rd Rockport, WA 98283</p>

2020-05-26 11:22:06	Chehalis Basin Flood Damage Reduction Project	Nadia	Carrim	Woodinville	WA	98072	isle4delfino@aol.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>Thank you to Conservation Northwest for creating awareness. I am a Northwest resident who loves to know my state has done its best to protect the ecosystems and habits that make the Northwest unique, healthy and thriving. I fully support and encourage alternative strategies to solve flooding and infrastructure problems with far more consideration for the land we call home. I do not support the Chehalis dam without further consideration on the impact this will have on the surrounding ecosystem. It is up to us to set an example of responsible activity and infrastructure as a state that has always prided itself on its interest in environmental solutions. This dam is not the best solution. We must do better. Thank you -Nadia</p> <p>From Conservation Northwest- I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead.</p> <p>In addition to serving as critical fish habitat, rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation. On top of unacceptable impacts to wild salmon and steelhead.</p> <p>While a massive new dam is unacceptable, so is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. 2020-04-29 23:14:21	Chehalis Basin Flood Damage Reduction Project	Debra	Chang	Bellingham	WA	98225	jazzkoo@hotmail.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River because it would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead, Washington's beleaguered State Fish.</p> <p>Rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Debra Chang 2500 H St Bellingham, WA 98225</p>

2020-05-26 17:36:17	Chehalis Basin Flood Damage Reduction Project	Georgia	Coleman	Seattle	WA	98105	gwc083@gmail.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead.</p> <p>In addition to serving as critical fish habitat, rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation. On top of unacceptable impacts to wild salmon and steelhead.</p> <p>While a massive new dam is unacceptable, so is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Georgia Coleman</p> <p>Seattle, WA 98105</p>

2020-05-01 11:23:46	Chehalis Basin Flood Damage Reduction Project	Nancy	Cooper	Bainbridge Island	WA	98110	nleecooper@gmail.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead, Washington's beleaguered State Fish.</p> <p>Rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Nancy Cooper 1643 Jeannette Pl NW Bainbridge Island, WA 98110</p>

2020-04-30 17:40:21	Chehalis Basin Flood Damage Reduction Project	Susan	Crampton	Twisp	WA	98856	scrampton@methownet.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>Although I live in North Central Washington, I pay attention to land, water, fish and wildlife issues in throughout Washington State. As a 73 year old resident of the Pacific NW, I have seen many of the practices that I grew up and took for granted to be shown to have side-effects. Instead of continuing on a trajectory to follow past mistakes, to "throw good money after bad", we need to make changes to do things in a different way, in a more long term sustainable way.</p> <p>I support the public and tribal input that looks to a better developed DEIS and inclusion of an alternative to building a dam for flood damage reduction. I support the language from Conservation Northwest below.</p> <p>-----</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Marion Crook 827 Dr M.L.K. Way Bremerton, WA 98337</p>

<p>2020-05-01 22:49:35</p>	<p>Chehalis Basin Flood Damage Reduction Project</p>	<p>Benjamin Cross</p>	<p>Cross</p>	<p>Tumwater</p>	<p>WA</p>	<p>98501</p>	<p>bekecr@gmail.com</p>	<p>Comments on proposed Chehalis River Dam DEIS</p>	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead.</p> <p>In addition to serving as critical fish habitat, rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation. On top of unacceptable impacts to wild salmon and steelhead.</p> <p>While a massive new dam is unacceptable, so is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Benjamin Cross 1122 39th Ct SE Tumwater, WA 98501</p>

The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Emily Davis</p> <p>Seattle, WA 98112</p>

2020-05-03 19:21:40	Chehalis Basin Flood Damage Reduction Project	Nathalie	de Beeck	Tacoma	WA	98406	ivyfern@msn.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project.</p> <p>I support sustainable development and improving salmon habitat, because our species are so depleted and in trouble already. I do not support the proposed strategy to build a large dam on the Chehalis River. This backward project would destroy hundreds of acres of carbon-capturing forest, migratory-species-friendly riparian habitat, and wetlands, and would degrade essential spawning grounds for Chinook and coho salmon as well as steelhead.</p> <p>In addition to serving as critical fish habitat, rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>A dam would irreversibly disrupt these animal highways and the wild spaces we as humans need too. The current Draft Environmental Impact Statement fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation. On top of unacceptable impacts to wild salmon and steelhead.</p> <p>While a massive new dam is unacceptable, so is the status quo. I support collaboration with local residents, tribes, and other community members to develop alternative strategies that support flood mitigation and local spaces while restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have only a limited time to get this right—a dam project would take us in the wrong direction for the twenty-first century.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Nathalie de Beeck</p>

2020-05-14 03:59:15	Chehalis Basin Flood Damage Reduction Project	Mary	DeVany	Vancouver	WA	98685	mdevany@earthlink.net	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead.</p> <p>In addition to serving as critical fish habitat, rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation. On top of unacceptable impacts to wild salmon and steelhead.</p> <p>While a massive new dam is unacceptable, so is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Mary DeVany 14507 NW 19th Ave Vancouver, WA 98685</p>

The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, patrick durkin 116 Stewart St Seattle, WA 98101</p>

2020-04-30 18:16:14	Chehalis Basin Flood Damage Reduction Project	Tim	Durnell	Rice	WA	99167	sdurnell@centurytel.net	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead, Washington's beleaguered State Fish.</p> <p>Rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Tim Durnell 3087 Daisy Mine Rd Rice, WA 99167</p>

2020-05-02 10:51:52	Chehalis Basin Flood Damage Reduction Project	John	Farrell	Bow	WA	98232	jfarrell@wavecable.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead.</p> <p>In addition to serving as critical fish habitat, rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation. On top of unacceptable impacts to wild salmon and steelhead.</p> <p>While a massive new dam is unacceptable, so is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, John Farrell 4347 Colony Mountain Dr Bow, WA 98232</p>

2020-05-01 12:41:16	Chehalis Basin Flood Damage Reduction Project	Emma	Fougere	Pullman	WA	99163	emmafougere12@gmail.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead.</p> <p>In addition to serving as critical fish habitat, rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation. On top of unacceptable impacts to wild salmon and steelhead.</p> <p>While a massive new dam is unacceptable, so is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Emma Fougere 1302 Cougar Way Pullman, WA 99163</p>

2020-05-04 09:56:17	Chehalis Basin Flood Damage Reduction Project	Joseph	Gardner	Seattle	WA	98133	joegardner21@gmail.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead.</p> <p>In addition to serving as critical fish habitat, rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation. On top of unacceptable impacts to wild salmon and steelhead.</p> <p>While a massive new dam is unacceptable, so is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Joseph Gardner 12508 N Park Ave N Seattle, WA 98133</p>

2020-04-30 06:17:18	Chehalis Basin Flood Damage Reduction Project	Michael	Gladstone	Tacoma	WA	98406	ondelanobay@gmail.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead, Washington's beleaguered State Fish.</p> <p>Rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Michael Gladstone 3305 N 22nd St Tacoma, WA 98406</p>

2020-05-25 20:45:15	Chehalis Basin Flood Damage Reduction Project	Julie	Glover	Clinton	WA	98236	julieg@whidbey.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>The Chehalis Basin contains key wildlife corridors that allow species to move between the Cascade Mountains, Willapa Hills and Olympic Peninsula. A proposal to build a massive dam on the Chehalis River in southwest Washington would SEVERELY THREATEN this ecosystem and degrade critical fish and wildlife habitat. That's why I'm giving my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project: DO NOT build a large dam on the Chehalis River!!!</p> <p>Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change. The proposed dam would irreversibly disrupt these animal highways. WHY does the current Draft EIS fail to analyze at all impacts to the migratory routes and connected habitats that wildlife need???</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people. PLEASE THINKSERIOUSLY ABOUT THIS!!!!</p> <p>Regards, Julie Glover 7292 Maxwellton Rd Clinton, WA 98236</p>

This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead, Washington's beleaguered State Fish.</p> <p>Rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Kristina Gravette 425 Mt Park Blvd SW Issaquah, WA 98027</p>

<p>2020-05-02 10:35:51</p>	<p>Chehalis Basin Flood Damage Reduction Project</p>	<p>Lisa</p>	<p>Halston</p>	<p>Redmond</p>	<p>WA</p>	<p>98053</p>	<p>nivette2@msn.com</p>	<p>Comments on proposed Chehalis River Dam DEIS</p>	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead.</p> <p>In addition to serving as critical fish habitat, rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation. On top of unacceptable impacts to wild salmon and steelhead.</p> <p>While a massive new dam is unacceptable, so is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Lisa Halston 6720 240th Way NE Redmond, WA 98053</p>

The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Susan Harris 1075 Hawley Way NE Bainbridge Island, WA 98110</p>

2020-05-04 10:50:59	Chehalis Basin Flood Damage Reduction Project	Katherine Harrison	Seattle	WA	98133	kateharrison@gmail.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead.</p> <p>In addition to serving as critical fish habitat, rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation. On top of unacceptable impacts to wild salmon and steelhead.</p> <p>While a massive new dam is unacceptable, so is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. On top of unacceptable impacts to wild salmon and steelhead.</p> <p>While a massive new dam is unacceptable, so is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Molly Henling 4816 NE 47th St Seattle, WA 98105</p>

2020-04-29 20:26:20	Chehalis Basin Flood Damage Reduction Project	Meghan	Heppner	Coupeville	WA	98239	mheppner@comcast.net	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead, Washington's beleaguered State Fish.</p> <p>Rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. On top of unacceptable impacts to wild salmon and steelhead.</p> <p>While a massive new dam is unacceptable, so is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Nick Holden 2902 NW 124th St Vancouver, WA 98685</p>

<p>2020-04-29 22:26:27</p>	<p>Chehalis Basin Flood Damage Reduction Project</p>	<p>Terry</p>	<p>holden</p>	<p>Prosser</p>	<p>WA</p>	<p>99350</p>	<p>hevelholden@hotmail.com</p>	<p>Comments on proposed Chehalis River Dam DEIS</p>	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead, Washington's beleaguered State Fish.</p> <p>Rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Kevin Hughes 1206 11th St Anacortes, WA 98221</p>

2020-05-01 09:25:52	Chehalis Basin Flood Damage Reduction Project	Kevin	Hughes	Anacortes	WA	98221	anevolver@gmail.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead, Washington's beleaguered State Fish.</p> <p>Rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Cynthia Jatul 6854 18th Ave NE Seattle, WA 98115</p>

2020-04-29 22:34:33	Chehalis Basin Flood Damage Reduction Project	Tara	Javadpour	Seattle	WA	98119	tara_27_99@yahoo.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead, Washington's beleaguered State Fish.</p> <p>Rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Mark Johnson 5880 Church Rd Ferndale, WA 98248</p>

2020-04-30 08:35:24	Chehalis Basin Flood Damage Reduction Project	Matt	Johnson	Seattle	WA	98118	northfalke@gmail.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead, Washington's beleaguered State Fish.</p> <p>Rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Matt Johnson 3504 S Morgan St Seattle, WA 98118</p>

2020-05-22 15:24:44	Chehalis Basin Flood Damage Reduction Project	Stephen	Kenny	Port Orchard	WA	98367	s_kenny10@yahoo.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead.</p> <p>In addition to serving as critical fish habitat, rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation. On top of unacceptable impacts to wild salmon and steelhead.</p> <p>While a massive new dam is unacceptable, so is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Stephen Kenny</p> <p>Port Orchard, WA 98367</p>

<p>2020-05-03 20:49:56</p>	<p>Chehalis Basin Flood Damage Reduction Project</p>	<p>Erik</p>	<p>Kingfisher</p>	<p>Port Townsend</p>	<p>WA</p>	<p>98368</p>	<p>erikjkingfisher@gmail.com</p>	<p>Comments on proposed Chehalis River Dam DEIS</p>	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. Please instead use more thorough watershed management approaches that incorporate 21st century forestry approaches to managing the forests there in a way that reduces runoff and increases overall water retention in the forests and soils. The technology to do this planning exists, the models can easily be run - it's the willingness of the forest owners to change that is the biggest hurdle.</p> <p>We need to be thinking 50+ years out, and with the predicted changes to the precipitation patterns, we need to be managing the forests in a way that service more than just short-term cash returns, and start to service the water needs and management that affects downstream landowners - especially farmers.</p> <p>This project as proposed would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead.</p> <p>In addition to serving as critical fish habitat, rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Elizabeth Klein 4801 Hyada Blvd NE Tacoma, WA 98422</p>

<p>2020-05-03 15:38:40</p>	<p>Chehalis Basin Flood Damage Reduction Project</p>	<p>Jesse</p>	<p>Kleinman</p>	<p>Seattle</p>	<p>WA</p>	<p>98105</p>	<p>yidlfidl@gmail.com</p>	<p>Comments on proposed Chehalis River Dam DEIS</p>	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead.</p> <p>In addition to serving as critical fish habitat, rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation. On top of unacceptable impacts to wild salmon and steelhead.</p> <p>While a massive new dam is unacceptable, so is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Unfortunately, ecological destruction also opens the possibility of new pandemics such as the one we are all suffering from now. Please explore alternatives that would reduce flooding while preserving and restoring vital habitats and meeting the needs of fish, wildlife, and local communities including various First Peoples communities.</p> <p>Thank you.</p> <p>Regards, Jesse Kleinman 4817 Terrace Dr NE Seattle, WA 98105</p>

I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Danielle Kuchler 1111 E University Way Ellensburg, WA 98926</p>

2020-04-29 20:14:40	Chehalis Basin Flood Damage Reduction Project	Walter	Kuciej	Seattle	WA	98199	walterk74@comcast.net	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead, Washington's beleaguered State Fish.</p> <p>Rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Yvonne Leach 10983 Point Vashon Dr SW Vashon, WA 98070</p>

2020-05-27 14:14:35	Chehalis Basin Flood Damage Reduction Project	Joyce	LeCompte	Rochester	WA	98579	joycelecompte@gmail.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead.</p> <p>In addition to serving as critical fish habitat, rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation. On top of unacceptable impacts to wild salmon and steelhead.</p> <p>While a massive new dam is unacceptable, so is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Joyce LeCompte PO Box 862 Rochester, WA 98579</p>

<p>2020-05-02 14:20:03</p>	<p>Chehalis Basin Flood Damage Reduction Project</p>	<p>Andrea</p>	<p>Lonseth</p>	<p>Sumner</p>	<p>WA</p>	<p>98390</p>	<p>backyardhousefinch@gmail.com</p>	<p>Comments on proposed Chehalis River Dam DEIS</p>	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead.</p> <p>In addition to serving as critical fish habitat, rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation. On top of unacceptable impacts to wild salmon and steelhead.</p> <p>While a massive new dam is unacceptable, so is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Andrea Lonseth 224 Alder Ave Sumner, WA 98390</p>

The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Debbie Mahder 303 NE 10th St Battle Ground, WA 98604</p>

<p>2020-05-01 12:03:34</p>	<p>Chehalis Basin Flood Damage Reduction Project</p>	<p>Marwa</p>	<p>Mahmoud</p>	<p>Seattle</p>	<p>WA</p>	<p>98105</p>	<p>marwajulie@hotmail.com</p>	<p>Comments on proposed Chehalis River Dam DEIS</p>	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead.</p> <p>In addition to serving as critical fish habitat, rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation. On top of unacceptable impacts to wild salmon and steelhead.</p> <p>While a massive new dam is unacceptable, so is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Marwa Mahmoud 5255 17th Ave NE Seattle, WA 98105</p>

On top of unacceptable impacts to wild salmon and steelhead.</p> <p>While a massive new dam is unacceptable, so is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Jack McLeod 17504 Valley Cir Dr Bothell, WA 98012</p>

These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Edward Mills 264 West Lake Sammamish Pkwy NE Bellevue, WA 98008</p>

2020-05-19 13:45:32	Chehalis Basin Flood Damage Reduction Project	Joan	Milton	Spokane	WA	99203	joanmiltonrd@hotmail.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River.</p> <p>I realize there needs to be action taken to prevent flooding but i do not think a good solution has yet been found. Please continue to look for options that would not be a detriment to Washington states' beautiful wildlife , especially the endangered species like the marbled murrelet, and sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, so is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>As noted in the Draft EIS, climate change has led to increased frequency and intensity of storms that put this area at risk. But, Washington states' innovative thinkers can come up with a better solution than this dam. that can balance the needs of fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Joan Milton 904 W Comstock Ct Spokane, WA 99203</p>

The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, James Mulcare 1110 Benjamin St Clarkston, WA 99403</p>

2020-04-30 09:03:13	Chehalis Basin Flood Damage Reduction Project	Susan	Murawski	Gig Harbor	WA	98329	s_murawski@hotmail.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead, Washington's beleaguered State Fish.</p> <p>Rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Susan Murawski 15621 171st Ave NW Gig Harbor, WA 98329</p>

2020-04-30 08:08:28	Chehalis Basin Flood Damage Reduction Project	Kim	Northrop	Spokane	WA	99224	mkimberlei@yahoo.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead, Washington's beleaguered State Fish.</p> <p>Rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. <p>2020-04-30 07:46:41</p>	<p>Chehalis Basin Flood Damage Reduction Project</p>	<p>Court</p>	<p>Olson</p>	<p>Bellevue</p>	<p>WA</p>	<p>98008</p>	<p>court.olson@yahoo.com</p>	<p>Comments on proposed Chehalis River Dam DEIS</p>	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to comment on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I oppose building a dam on the Chehalis River. It would disrupt natural eco-systems, including the salmon spawning run and occasional natural flooding of the traditional flood plain along the river. We must allow natural systems to prevail, especially in our waterways and waterway basins. Instead we must redirect human encroachment on the flood plain so as to preserve its natural habitat and occasional natural flooding replenishment.</p> <p>It is well past time for our society to realize the environmental destruction caused by damming our rivers. Recently, we are starting to do that as we have seen dams being removed in a restorative manner. (For example the Elwha river dam which was recently removed on the upper Olympic peninsula).</p> <p>No doubt, some property owners in the Chehalis Basin wish to control the river so that their use of their property is not disrupted by floods. My answer to them is that their property was purchased and is being used with the river and flood history knowledge made publicly available ahead of time. Enhancing their property value by damming the river is not a right given with such property ownership. The public owes these property owners no such right to, at public expense, change nature.</p> <p>With some sympathy for the reduction of human suffering at the time of a flood, I suggest that flood plain uses and especially building of structures must be strictly prescribed and limited. Perhaps special loans or grants are needed to implement a transition to such limitations where encroachment has already occurred. Creation of a new aid program, or, if one already exists, bolstering the existing one, to help transition now existing infringements on the floodplain should be considered in lieu of building a dam. Surely, such a program could be structured to be less costly than building a dam, and also be designed to foster harmony between property owners and natural ecosystems.</p> <p>I understand from what I've read elsewhere that the dam would threaten critical habitat of endangered or threatened species. We humans must stop putting the interests of a few property owners and their concept of land ownership above the greater good of the biosphere that we share. There are limits to the rights of property owners having to do with ecosystem preservation. Our modern industrial society has repeatedly pressed beyond those limits and we can no longer allow that mindset to continue, else we endanger survival of the planet as we know it, and thus survival of the human joy of appreciating the planet we share.</p> <p>Please do not allow a new dam to be built on the Chehalis River. Let nature be nature.</p> <p>Thank you.</p> <p>Regards, Court Olson 15817 SE 26th St Bellevue, WA 98008</p>

2020-04-30 17:02:44	Chehalis Basin Flood Damage Reduction Project	Lori	Orcutt	Bellingham	WA	98228	loriorcutt@yahoo.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead, Washington's beleaguered State Fish.</p> <p>Rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Lori Orcutt PO Box 29254 Bellingham, WA 98228</p>

2020-05-26 01:15:13	Chehalis Basin Flood Damage Reduction Project	Paige	Pearson	Lynden	WA	98264	paigembpearson@gmail.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead.</p> <p>In addition to serving as critical fish habitat, rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation. On top of unacceptable impacts to wild salmon and steelhead.</p> <p>While a massive new dam is unacceptable, so is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Paige Pearson 966 Adrian Dr Lynden, WA 98264</p>

I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, James Postle 905 132nd St SW Apt B104 Everett, WA 98204</p>

2020-04-30 07:28:06	Chehalis Basin Flood Damage Reduction Project	amy	powell	Renton	WA	98059	schillingera@hotmail.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead, Washington's beleaguered State Fish.</p> <p>Rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Ben Rall 2217 W Crown Ave Spokane, WA 99205</p>

2020-04-29 20:02:44	Chehalis Basin Flood Damage Reduction Project	Ronald	Ramey	Everett	WA	98203	mmrr.ramey@gmail.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead, Washington's beleaguered State Fish.</p> <p>Rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Ronald Ramey 4630 Mermont Dr Everett, WA 98203</p>

2020-04-30 08:11:12	Chehalis Basin Flood Damage Reduction Project	Timothy	Randolph	Seattle	WA	98117	timwrandolph@gmail.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide input on Washington State's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. The proposed dam would destroy hundreds of acres of forest, habitat, and wetlands. It would eliminate spawning grounds for salmon and steelhead, both of which are under extreme stress from habitat loss. I do NOT support the proposed strategy to build a dam on the Chehalis River.</p> <p>The Skookumchuck and Chehalis rivers and surrounding areas are critical for the diversity and survival of wildlife in the Chehalis Basin. Scientific studies show that these rivers and regions provide crucial connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula needed for a wide range of species to survive.</p> <p>The proposed dam would forever alter this habitat. The Draft EIS fails to analyze impacts to the migratory routes and connected habitats. It does, however, demonstrate that climate change-fueled storms add to the size of the problem, and so the proposed dam is NOT the solution.</p> <p>The proposed Flood Retention Facility and reservoir would put pressures on several endangered species and threaten sensitive amphibians and other wildlife already experiencing unprecedented impacts from habitat loss.</p> <p>Please consider the full extent of science surrounding the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam.</p> <p>Thank you.</p> <p>Regards, Timothy Randolph 6515 Earl Ave NW Seattle, WA 98117</p>

<p>2020-05-25 12:36:44</p>	<p>Chehalis Basin Flood Damage Reduction Project</p>	<p>Judy</p>	<p>Rieke</p>	<p>Seattle</p>	<p>WA</p>	<p>98103</p>	<p>riekefarr@gmail.com</p>	<p>Comments on proposed Chehalis River Dam DEIS</p>	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead.</p> <p>In addition to serving as critical fish habitat, rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation. On top of unacceptable impacts to wild salmon and steelhead.</p> <p>While a massive new dam is unacceptable, so is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Judy Rieke 6720 East Green Lake Way N Seattle, WA 98103</p>

2020-04-30 13:40:14	Chehalis Basin Flood Damage Reduction Project	Janna	Rolland	Seattle	WA	98115	jannarolland@hotmail.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead, Washington's beleaguered State Fish.</p> <p>Rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Janna Rolland 6227 34th Ave NE Seattle, WA 98115</p>

We are in the middle of a pandemic that has shut down the world. Climate change is real. We know that we need to make changes. We know we cannot control nature successfully. We know that when you build on a flood plain you will flood. We know when we cut down the trees that hold water and earth there is more flooding. Any more things you need me or anyone else to tell you that you already know? EVOLVE! USE SCIENCE, YOUR BRAINS, YOUR REASONING. THE LAND IS FOR ALL. Relocate your box stores and don't build where it floods. NO MORE DAMS! We need to work on freeing the waters that we have already dammed up. PLEASE DO BETTER!</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Mike Schmidt 1327 N Northlake Way Seattle, WA 98103</p>

<p>2020-05-01 22:57:45</p>	<p>Chehalis Basin Flood Damage Reduction Project</p>	<p>Adara</p>	<p>Schneider</p>	<p>Seattle</p>	<p>WA</p>	<p>98105</p>	<p>adaras@uw.edu</p>	<p>Comments on proposed Chehalis River Dam DEIS</p>	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead.</p> <p>In addition to serving as critical fish habitat, rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation. On top of unacceptable impacts to wild salmon and steelhead.</p> <p>While a massive new dam is unacceptable, so is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Paul Sisson PO Box 598 Winthrop, WA 98862</p>

<p>2020-04-30 12:03:44</p>	<p>Chehalis Basin Flood Damage Reduction Project</p>	<p>Jarad</p>	<p>Skeels</p>	<p>Kennewick</p>	<p>WA</p>	<p>99336</p>	<p>drysideoutfitters@gmail.com</p>	<p>Comments on proposed Chehalis River Dam DEIS</p>	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead, Washington's beleaguered State Fish.</p> <p>Rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. <p>2020-04-30 17:41:22</p>	<p>Chehalis Basin Flood Damage Reduction Project</p>	<p>Blaine</p>	<p>Snow</p>	<p>Olympia</p>	<p>WA</p>	<p>98506</p>	<p>snowinolympia@gmail.com</p>	<p>Comments on proposed Chehalis River Dam DEIS</p>	<p>To the Chehalis Basin Flood Control District:</p> <p>I'd like to offer my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. My view is that the proposed strategy to build a large dam on the Chehalis River is a bad idea. Experts have said that this project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead, Washington's beleaguered State Fish. We cannot afford to lose more quality fish habitat.</p> <p>Rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>It is tragic that the proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. The state has done a great experiment in removing the Elwha river dam, which has proven extremely successful for all parties involved. So why adding another dam to the Chehalis to serve one constituent while negatively affecting all others (tribes, environment, fish, citizens)?</p> <p>Thank you.</p> <p>Regards, Mani Soma 12043 11th Ave NW Seattle, WA 98177</p>

This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead, Washington's beleaguered State Fish.</p> <p>Rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Andrew Stahl 10005 SW 178th St Vashon, WA 98070</p>

2020-05-25 23:30:32	Chehalis Basin Flood Damage Reduction Project	Keith	Staley	Chehalis	WA	98532	keith.k.staley@gmail.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River.</p> <p>Before moving to live on the Chehalis River near Pe Ell I lived on property located on Cow Creek in southern Oregon. Below our property was Galesville Reservoir. It looks very much like sketches I have seen of the proposed dam. There was no passage provided for fish which ended the salmon runs above the dam. The dam brought with it increased traffic. With the traffic came increase noise, trash & road kill. So to me it's a case of do you want to change nature or mans habits (living in flood plans, poor logging practices & impacting the climate in general). My wish would be for mankind to change it's habits rather than always requiring nature to pay for our lack of our vision.</p> <p>Thank you. Keith Staley</p> <p>Regards, Keith Staley 4958 SR 6 Chehalis, WA 98532</p>

Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Sharon Stroble 2246 12th Ave W Seattle, WA 98119</p>

2020-05-01 20:18:26	Chehalis Basin Flood Damage Reduction Project	Elizabeth	Strong	Tacoma	WA	98422	lizzy_bug_713@hotmail.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead.</p> <p>In addition to serving as critical fish habitat, rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation. On top of unacceptable impacts to wild salmon and steelhead.</p> <p>While a massive new dam is unacceptable, so is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. <p>2020-04-30 14:13:25</p>	<p>Chehalis Basin Flood Damage Reduction Project</p>	<p>Michael</p>	<p>Tanksley</p>	<p>Woodinville</p>	<p>WA</p>	<p>98072</p>	<p>wmtanksley@comcast.net</p>	<p>Comments on proposed Chehalis River Dam DEIS</p>	<p>To the Chehalis Basin Flood Control District:</p> <p>There are many reasons why the proposed dam in the Chehalis River Basin should NOT move forward.</p> <p>This dam is unnecessary. Building and infrastructure should be directed away from flood plains. When necessary to place infrastructure in these areas, it should be built to accommodate the occasional high water events.</p> <p>I do not want to see my tax dollars used for a new destructive dam in this era when we are removing more (poorly considered) dams that we are installing - and for good reasons.</p> <p>I approve of the balance of this message:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead, Washington's beleaguered State Fish.</p> <p>Rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p>

The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Aiko Torkelson 1107 E Madison St Seattle, WA 98122</p>

2020-05-20 09:19:42	Chehalis Basin Flood Damage Reduction Project	Trisha	Towanda	Shelton	WA	98584	trisha.towanda@gmail.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead.</p> <p>In addition to serving as critical fish habitat, rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation. On top of unacceptable impacts to wild salmon and steelhead.</p> <p>While a massive new dam is unacceptable, so is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Trisha Towanda 3380 W Dayton Airport Rd Shelton, WA 98584</p>

2020-04-30 15:55:41	Chehalis Basin Flood Damage Reduction Project	Violet	Van Diest	Bellingham	WA	98229	nettakeith@gmail.com	Comments on proposed Chehalis River Dam DEIS	<p>To the Chehalis Basin Flood Control District:</p> <p>I'm writing to provide my input on the state's Draft Environmental Impact Statement (DEIS) for the proposed Chehalis River Basin Flood Damage Reduction Project. I do not support the proposed strategy to build a large dam on the Chehalis River. This project would destroy hundreds of acres of quality forest, riparian habitat, and wetlands, and degrade important spawning grounds for Chinook and coho salmon as well as steelhead, Washington's beleaguered State Fish.</p> <p>Rivers like the Chehalis and Skookumchuck and the lush riparian areas surrounding them act as highways for the diverse wildlife living in the Chehalis Basin. These highways allow animals to move around, find food and mates, and seek new habitat as our climate changes. Scientists have identified connections between Washington's South Cascades, Willapa Hills and Olympic Peninsula as beneficial for a wide range of species, especially in the face of climate change.</p> <p>The proposed dam would irreversibly disrupt these animal highways. The current Draft EIS fails to analyze impacts to the migratory routes and connected habitats wildlife need at all, let alone propose how they could be mitigated. Building and operating the Flood Retention Facility and reservoir would also put additional pressures on Endangered species like the marbled murrelet, as well as threaten sensitive amphibians and other small wildlife; animals that are already experiencing unprecedented impacts from other sources of habitat degradation.</p> <p>While a massive new dam is unacceptable, neither is the status quo. I support collaboration with local residents, tribes and other stakeholders to develop alternative strategies that support flood mitigation and local communities while also restoring forests, floodplains and habitat. Because most of the largest flood damages that the proposed dam would prevent come in the late century scenarios, we have some time to get this right.</p> <p>Please address the impacts a proposed dam would have on migratory routes and habitat connectivity, as well as develop flood reduction and habitat restoration actions that do not include building a large dam. The current and future problems from floods in the Chehalis Basin are a results of many decades of human building, land management, and transportation patterns. As the Draft EIS demonstrates well, climate change-fueled storms only add to the size of the problem. We need out-of-the box solutions that don't force unacceptable trade-offs for fish, wildlife and people.</p> <p>Thank you.</p> <p>Regards, Violet Van Diest 15 Winter Creek Place Bellingham, WA 98229</p>
